**Answer.**—Force required at the toggle pins is $\frac{120,000 \times 40}{24} = 200,000$ pounds. Area of 12-inch piston is $12 \times 12 \times .7854 = 113.1$ sq. ins. Actual force on piston required $= \frac{200,000}{4} = 50,000$ pounds. Pressure per square inch $= \frac{50,000}{113.1} =$ 442.08. A pressure of about 500 pounds would be used for this work.

* * *

**Question.**—An air pump having a piston 10 inches in diameter is designed to work against a pressure of 15 pounds per square inch. The pump piston is operated from the end of a lever, the other end of which is pivoted to the engine frame, and the engine crosshead is attached at a point 12 inches from the pivot. If the total length of the lever be 32 inches, what force must be exerted upon it by the crosshead?

**Answer.**—Area of air pump piston is $10 \times 10 \times .7854 = 78.54$ sq. in. Total pressure upon air pump piston is $78.54 \times 15 = 1178.1$ pounds. The distance of air pump connection from the fulcrum is 32 inches, and the distance of the crosshead connection from the fulcrum is 12 inches. Force exerted by crosshead is, then, $\frac{1178.1 \times 32}{12} = 3141.6$ pounds.

* * *

**Question.**—In a differential chain hoist, the large sheave of which is 10 inches in diameter and the small one 8 inches, what weight on the hook would be equivalent to 60 pounds on the chain?

**Answer.**—The chain winds up on the 10-inch sheave and unwinds off the 8-inch. The difference between these two diameters is 2 inches. The radius of the 10-inch wheel represents the power arm of the lever and the radius of a 2-inch sheave represents the work arm, and the load that can be lifted is $\frac{5 \times 60}{1} = 300$ pounds. On account of the loop in the chain this forms practically half of the actual load. The load on the hook balanced by the pull of the chain, neglecting friction, is, therefore, $300 \times 2 = 600$ pounds.

* * *

**Question.**—A hydraulic elevator is operated by a piston 16 inches in diameter and 240 pounds per square inch of water pressure. There are two moving sheaves and two stationary sheaves, a single cable going to the car. What load can be lifted by the elevator?

**Answer.**—As the piston works against five cables, while the elevator is taken by one, the leverage ratio of the piston to elevator is 1 to 5. Area of piston $= 16 \times 16 \times .7854 = 201.06$ sq. ins. Total pressure on piston is $201.06 \times 240 = 48,254.4$ pounds. The load that can be lifted by the elevator, therefore, is $\frac{48,254.4}{5} = 9650.9$ pounds, or about 4½ tons.

* * *

**Question.**—A hydraulic jack has a ram 2 inches in diameter and a plunger ½-inch in diameter. It is operated by a lever 30 inches long, which is pivoted at the end, and is applied to the plunger two inches from the fulcrum. If a man is capable of exerting 120 pounds on the lever, what load could he lift with the jack?

**Answer.**—Area of ram is $2 \times 2 \times .7854 = 3.1416$ sq. in. Area of plunger is $.5 \times .5 \times .7854 = .19635$ sq. in. Ratio of ram to plunger is $\frac{3.1416}{.19635} = 16$ to 1.

Length of lever power arm is 30 inches. Length of work arm is 2 inches. Ratio of work to power is 15 to 1. Total ratio of work to power is $16 \times 15 = 240$ to 1. If 120 pounds be applied to the lever, the load lifted will be $120 \times 240 = 28{,}800$ pounds, or 14.4 tons.

* * *

**Question.**—Two shafts of equal size are connected by spur gears, the driver having 200 teeth and the driven 240 teeth. If the driven shaft become jammed and the power were sufficient, which shaft would most likely be broken?

**Answer.**—The radii of the gears are directly proportional to the number of teeth they contain. The ratio of the radii to each other is, therefore, 240 to 200, or 6 to 5. The driven shaft would, therefore, be first twisted off, and to be of equal strength the driven shaft should be one-sixth stronger.

* * *

**Question.**—A lathe is driven through double-back gears. Gears have 144 and 120 teeth, and corresponding pinions have 24 and 30 teeth. The pulley diameter is 16 inches and a double belt 4 inches wide is used. What cutting force could be secured at the tool when turning a pulley 24 inches in diameter?

**Answer.**—The effective pull of a belt in this position will be about 40 pounds per inch of width, and for a 4-inch pulley this becomes $40 \times 4 = 160$ pounds. The reduction in speed from the pulley to spindle is $\frac{120 \times 144}{30 \times 24} = 24$.

The circumference of the driving pulley is $16 \times 16 \times .7854 = 5.265$, and circumference of the pulley being turned is $24 \times 24 \times .7854 = 75.398$ inches. The relative peripheral speed is, therefore, $24 \times 50.265$ to $1 \times 75.398 = 1206.36$ to 75.398, or 1 to 16.

The power multiplied by its distance equals work multiplied its distance, or force on tool $= \frac{160 \times 16}{1} = 2{,}560$ pounds.

* * *

**Question.**—A hand punch is operated by a 6-foot lever. The load comes two inches from the end of the lever. What force on the lever would be required to punch a half-inch hole in ¼-inch plate.

**Answer.**—The shearing area of the hole is, circumference of hole × thickness of plate $= 1.57 \times 0.25 = .3925$ sq. in.

Shearing resistance of plate = 50,000 pounds per square inch. Force required at punch is, therefore $\frac{50{,}000}{.3925} = 12{,}378$

Length of lever is 72 inches. Leverage ratio is, therefore, 72 to 2, or 36 to 1.

Force on lever required is 344 pounds nearly.

## THE GREAT ZEPPELIN FAILURE.

PROBABLY one of the greatest surprises of the present war, says a writer in the Liverpool Journal of Commerce, has been the futility of the much-vaunted Zeppelins of the Germans, as after the one or two record journeys made by these crafts, some considerable time before the war, it was anticipated in several quarters that their development would render them formidable weapons in the future.

A great deal of stress was laid upon these performances by certain parties with the intention of pressing our Government to pay more attention to, and, incidentally, to spend large sums of money upon these giant gas-bags, but, fortunately, the limitations imposed upon them by weather conditions and the necessity for having special sheds in which to house them were foreseen by the authorities, and only a relatively small sum was spent in building and experimenting with them.

### Limitation Features.

Limitations imposed by the weather are usually interpreted by most people to mean the inability of these vessels to successfully combat gales and rapid changes of wind, but although this is a most important point, it is not more so than the loss of lifting power engendered by rain and snow storms. It has been pointed out on more than one occasion that the additional weight caused by the settling of rain on the envelope, and to a greater degree by the accumulation of snow, is a most serious matter for lighter than air machines, a rough approximation having shown that two or three tons of extra weight might easily be caused on an airship of about 500 feet in length.

It is interesting to learn that an expert has recently expressed the opinion that four tons of snow could lodge on the envelope of a Zeppelin, which at once shows the impossibility of ever building these machines so as to be independent of the weather. It is almost certain that four tons represents the weight of all bombs, ammunition, ballast, and portable stores carried by a present-day Zeppelin, so that in the event of one of these craft being caught in a snowstorm it must descend. This appears to have been exactly what happened to the two German dirigibles that were recently wrecked off the coast of Denmark.

A foreign report stated that the motors also failed at the same time that the storm was encountered, but as the coincidence is rather remarkable (snow in the atmosphere not being an adequate cause for the failure of an internal combustion engine), and the snowstorm, as shown above, is quite sufficient reason for their descent, it seems almost certain that it was the additional weight of the accumulation of snow which was the direct cause for the loss of these latest Zeppelins, as they are believed to have been.

It must not, however, be assumed that because of the great number of German airships that have been lost solely on account of weather conditions that Britain may not have a visit from them on some occasion during the present war. They have proved themselves capable of exceedingly long journeys under settled barometric conditions, and it is safe to say that the remaining Zeppelins will be very carefully nursed for the remainder of the winter, with the object of giving some return for the money spent upon them when the summer is again with us.

### The Aeroplane Success.

Now that the Kaiser's experts have learnt by bitter experience that they have "backed the wrong horse" by expending such enormous sums of money on these delicate craft, it is in the highest degree probable that the Germans will not proceed with the construction of any more new machines for war purposes, especially bearing in mind the fact that their essential "resting places" are so easily destroyed by daring aviators, as was the case in the Dusseldorf and Friedrickshaven raids. We have, however, gained the enormous advantage that these sums of money already expended on them were not spent in aeroplanes, which have proved themselves such valuable additions to our army and navy, mainly through the instrumentalwity and foresight of Mr. Churchill in insisting on the rapid development of this arm of the services. The extraordinary feats performed by our aviators and the thorough reliability of the machines themselves prove that the course of the war must be profoundly influenced by this policy, and we should be eternally thankful to our Government Departments that while Germany was wasting huge sums of money on her gas-bags we were busy preparing the most efficient Royal Flying Corps.

**Canadian Pig Iron in 1914.**—According to a preliminary report just issued by the Department of Mines, Ottawa, the production of pig iron in Canada in the calendar year 1914 fell over 30 per cent. compared with 1913. The total was 783,164 net tons, which is the smallest since 1909. Of this 9,380 tons was made with charcoal and 773,784 tons with coke. Based on an estimate of $12.77 per ton at furnace, the value is placed at $10,002,856. The classification of production, according to the purpose for which it was intended was: Bessemer, 230,817 tons; basic, 346,553 tons; foundry and malleable, 205,794 tons.

# PROGRESS IN NEW EQUIPMENT

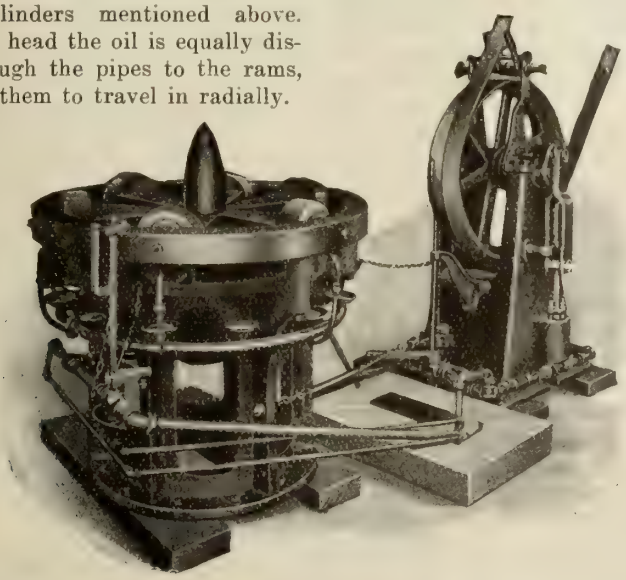
## A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

### HYDRAULIC SHELL-BANDING MACHINE.

THE hydraulic compressing machine here described and illustrated is a product of the West Tire Setter Co., Rochester, N.Y. It is specially adapted to the compressing of the copper bands on to shrapnel shells and other projectiles, and consists of a cast iron base in the form of a circle, on to which is mounted a 36-in. inside diameter steel ring. Inside of this ring are placed six rams or cylinders, equally spaced. These, when pressure is applied, are caused to travel radially toward the centre of the machine.

Against the faces of the rams are placed six V-shaped dies or blocks, which take a bearing against the outside of the band, and press it home in the groove as the rams travel towards the centre of the machine. These blocks or dies are carefully machined to the proper circle and form to press the band, and also spread it to fill the groove in the shell, means being provided for holding the bands at just the right height to enter the groove, the shell being held in a vertical position.

Oil is used as a pressure medium, it being forced into the machine by means of a belt-driven power pump, which draws the oil from the oil tank and carries it to the centre of the base of the press, where is located an oil head, from which pipes are run to each of the six rams or cylinders mentioned above. From this oil head the oil is equally distributed through the pipes to the rams, thus causing them to travel in radially.



HYDRAULIC SHELL BANDING MACHINE.

The amount of pressure required for the compressing of these copper bands depends largely upon the width and thickness of the band and the amount it must be spread to fill width of groove, rather than upon the diameter of the shell. This machine, however, is capable of giving 30 tons pressure on each of the six rams, or a combined pressure of 180 tons, and this is sufficient to compress any of the ordinary copper bands on shrapnel shells.

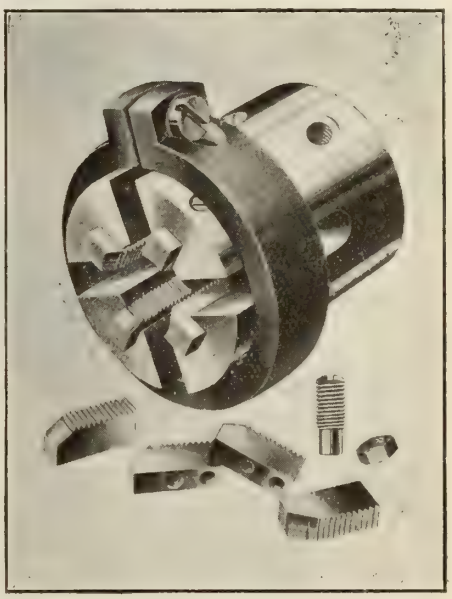
The machine is capable of compressing at least two bands per minute, depending largely, of course, upon the operator and also to the other facilities for handling. By changing the dies the machine can be adapted to any diameter of shell within its capacity.

This product is one of a large line of compressing machines built by the West Tire Setter Co., and we are advised that they are now building for shipment a tire-setting machine for compressing cold steel tires 12 ins. wide by 1⅜ ins. thick, ranging in various diameters up to 6 ft., and we understand that they have built machines for handling tires over 9 ft. in diameter. Machines to Canadian order are built in Hamilton, Ont.

### PIPE-THREADING DIE FOR SCREW MACHINES.

A NEW die for producing pipe threads on hand and automatic screw machines, turret lathes, etc., has recently been brought out by the National Acme Mfg. Co., Cleveland, Ohio, and Montreal, Canada. The die is not intended to supplant the special forms now in use upon pipe machines or more elaborate tools used for threading attachments and pipe fittings. These dies are made on the spring principle, and furnish many marked improvements over the older forms of such tools.

The body is made of a special steel and is milled into four prongs like the regular spring die. These prongs are



ACME PIPE DIE, SHOWING PARTS.

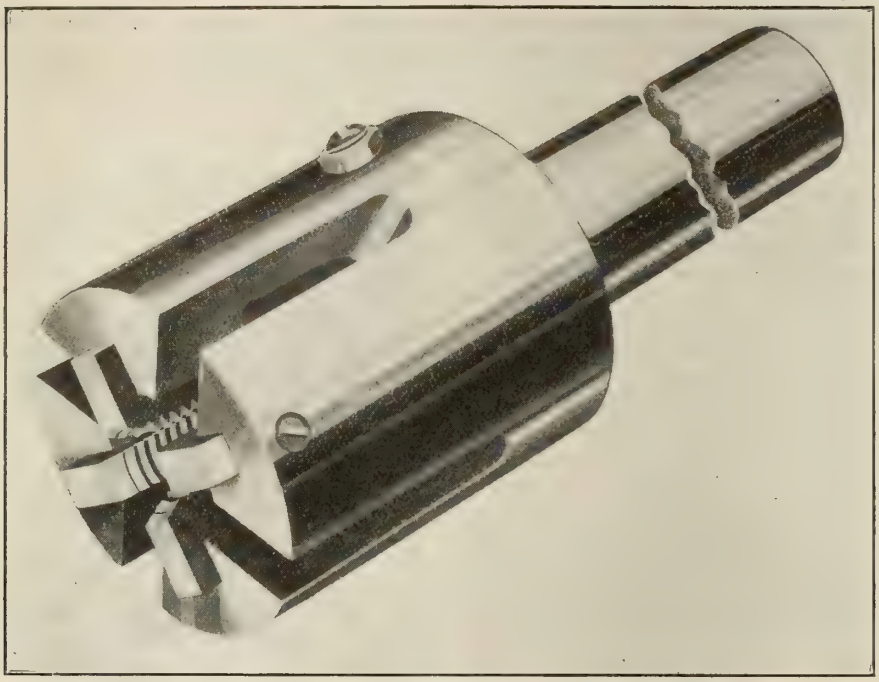
broached to receive chasers which extend back into the body only far enough to accommodate the longest pipe thread likely to be cut. They are fastened to the body by screws and dowel pins in such a way that they may be easily removed for sharpening or replacement.

This arrangement gives a very heavy body, with plenty of chip room, space for lubricant, and other essentials of free cutting. The stiffness of the prongs would probably limit the adjustment possible by means of the collar. This, however, could be easily overcome by judicious shimming if such a variation were required. The addition of weight and strength to the body part which is required to resist severe cutting strains is no doubt a great advantage.

The chasers for these dies are accurately hobbed and cleared to cut freely. Being in small pieces, they are much more easily hardened with uniformity than are the cutting lands of a solid die, thus obtaining the advantages of opening and closing dies in this respect. The clamping collar is fitted with four suitable bearing surfaces to place the closing effect most suitably upon the prongs.

Shanks are furnished rough or finished to fit the turret hole of any machine. The large or die end of the shank has a

free fit in the die body to allow the die to centre itself on slightly uneven work. This floating effect is said to greatly increase the lasting qualities of the chasers. A heavy dog-point screw passing through the die body into the shank and held by a countersunk hexagon nut



ACME PIPE DIE ASSEMBLED.

furnishes the drive between the body and the nut.

Each outfit includes one set of dies, one clamp collar, and one shank fitted to the die body.

## CONCERNING A BURST FLYWHEEL.

WRITING in the Vulcan of March, F. O. Beckett gives an interesting account of how a flywheel burst a few years ago in a works at Sheffield. It appears that the pin holding the valve to the spindle of the boiler stop valve had been replaced by a common 5-16 in. bolt, instead of a properly fitted pin, and owing to heavy vibration the nut worked off and the bolt fell out. The bolt, of course, soon found its way along the steam pipe and jammed in the double beat throttle valve.

The engine was direct coupled to a rolling mill, and, as soon as the load went off, the governor became inoperative in consequence of the throttle valve being fouled. As soon as the engineer-in-charge saw the speed of the engine increasing, he threw off the governor belt and tried to close the throttle by hand; failing in this, he ran to the boiler stop valves, but whilst closing No. 1 valve the flywheel burst and completely wrecked the engine.

One piece of the rim went through the roof and struck the flange of the dome crown of one of the boilers, indented the plate, but fortunately did no further damage. Another piece cleared the works, crossed the River Don, and buried itself—some say 6 feet deep—at the door of a cottage, from which, at the moment, by a strange coincidence, a funeral procession was emerging. Fortunately this piece also did not cause personal injury.

## ROTARY AIR PUMPS.

AT a recent meeting of the Junior Institution of Engineers, A. Arnold, in a paper on "Rotary Air-Pumps," gave a good description of the Worthington hydraulic vacuum pump, the "Kinetic," the Leblanc, the Rees Roturbo, the Wheeler or A.E.G., and the Willans Muller air-pumps, in which, he said, the evolution of the rotary air-pump is a natural outcome of progress in other directions, particularly the perfection of the steam-turbine, and its employment in cases in which the highest efficiency is required. The simplest rotary air-pump is, perhaps, the ejector condenser, which has the advantage of being its own condenser. The essence of the trouble with the ejector condenser is to get the water to entrain the air effectively. If the water-jet could be split up into little parcels, and entrap a plug of air between successive parcels, it would be much more effective, and this is the idea from which the Leblanc air-pump has been evolved.

In the Rees Roturbo rotary air-pump the injector water is mechanically controlled both at injector and discharge from the vacuum space, and the risk of the ejector "choking," and breaking the vacuum, is eliminated. The difficulty of inducing the water to entrain a reasonable volume of air is solved in the Worthington hydraulic vacuum pump by a helical form of jet, produced by the action of the water in an ejector upon a peculiarly-shaped gun-metal wheel.

## SUPPLEMENTARY ESTIMATES.

SUPPLEMENTARY estimates for the current year were tabled in the House by the Minister of Finance on Saturday, March 27, amounting to $4,364,541. This includes $2,616,999.90 chargeable to consolidated fund account, $1,538,845 chargeable to capital, and $208,695.63 for unprovided terms.

The items include $300,000 for the new Halifax terminals, $832,845 for the Transcontinental Railway, $350,000 for the Hudson Bay Railway, $30,000 for the Welland Canal, $101,636.50, part subsidy to the Canadian Vickers for the construction of the Montreal ship drydock, $10,000 for the relief of destitute Indians in Ontario and Quebec, $18,900 for more seed grain for the Prairie Provinces, $29,900 for destitute Indians in the Prairie Provinces and North-West Territories, $10,000 for destitute Indians in British Columbia, $10,000 for the relief of destitute Indians generally, $10,000 in connection with the smallpox epidemic, $50,000 for the relief of sufferers in the Hillcrest colliery disaster, $13,000 for the expenses of the Acting High Commissioner in London, $16,500 to widows and other dependents of the crew of the lost Government steamer Sharon, $365,000 for land mail service, $300,000 for railway mail service, $105,000 for rural mail boxes, and $5,000 to the Canadian Import Company for the recovery of mails from the Empress of Ireland.

## SOLDER TO MELT AT 160° F.

W. J. A. asks for the constituent parts of a solder that will melt at a temperature of 160 degrees F., also how much of each of the various materials would be required to make a certain quantity, together with the total cost. The following will, it is hoped, furnish the data called for in the query:

**Solder to Fuse at 160° F.**

| | Per 100 lb. | Cost per lb. |
|---|---|---|
| Cadmium ..... | 15.4 | $3.00 |
| Bismuth ..... | 38.4 | 4.50 |
| Lead ..... | 30.8 | 0.06 |
| Tin ..... | 15.4 | 0.57 |
| | 100.0 | $8.13 |

This works out at about $2.30 per lb. Although not absolutely certain, we believe that the Canada Metal Co., Toronto, can make up such a solder and are in a position to retail it at something like $2 per pound.—Edwin Newsome.

## A PLEA FOR PATRIOTISM.

WE had the pleasure of hearing Sir George Foster, Canadian Minister of Trade and Commerce address Ward Three Conservative Association, Toronto, last Friday evening. His subject of patriotism was too big and too important, and his heart too sincere about it for even a streak of politics to enter. Further, the eloquent and masterly, yet appealing manner with which he handled it, left no doubt on the minds of those present that he at least is not one of our "boat rockers," otherwise our self-seekers. Patriotism, he made very clear, meant sacrifice, and not its present-day substitute—skilfully masked service to our individual profit.

Since this European War started there has been a woeful absence of that patriotism of which Sir George spoke in our business and public life, particularly with respect to the circumstances which bring these into touch with each other. Unsavory revelations and disclosures are becoming an almost every-day occurrence relative to outfitting our various overseas contingents, and we are somewhat suspicious that conditions may yet become sufficiently intolerable in the matter of munitions of war manufacture to Allies order, to break cover.

We are just sufficiently lacking in that patriotism which Sir George Foster so masterly propounded as to have become impatient to know—not what Canada is going to get out of this European War, but what we—you and I are going to get out of it. What we are going to put into it of service and sacrifice is to all appearance the very last thing thought of. Hence, in the full knowledge of hardship and suffering and barrenness of opportunity of those who have placed their lives at our Empire's disposal, there is abundant evidence that too many of us are almost wholly and unreservedly "on the make."

"This war will sadden us," said Sir George, "but it will make us a more serious people. It will teach us that there is something more to live for than business, speculation and pleasure; it will teach us to look back on the past; teach us that the liberties given to us were given to keep and pass on. Our work is never done. Our duty is self-denial, self-sacrifice, the laying down of life blood for immeasurably deeper and greater things: for things that make for national and Imperial life."

It is painfully evident that we have not yet reached the "serious" stage, much less that which will be saddening, and, while disclaiming even a trace of natural tendency to pessimism, we are convinced that both the serious and saddening stages will materialize in our midst before the clash of arms in Europe ceases.

It is encouraging, yes and refreshing to have a public man step out even once in a while, if for no other purpose than to expose the hollowness and mediocre accomplishments of those with whom he is associated. Similar action on the part of a business man is likewise encouraging and refreshing. In either case it goes to show that politics or business constitute as they should, only a part of the being of each.

Of such rare occurrences, however, are these experiences, that we come to look upon them as a species of freak. We are so accustomed to speak of so-and-so as a successful politician, and somebody else as a successful business man that we unthinkingly—in many cases truthfully perhaps, so credit them as regards every feature of their being.

Sir George Foster has amply proved that being born a man, and while incidentally a politician and Canada's Minister of Trade and Commerce, he is living and acting as a man. Politics is one of his side lines, just as law, engineering, journalism, teaching, etc., should be reckoned as our side lines. The trouble with too many of us is that although born men, we live by our wits, and at the end of life's thread pass out on our own judgment as fools.

If we lack patriotism, we are bound to be lacking in straight up-and-down every-day honesty, and if Sir George's appeal for the former bears the fruit it deserves, then with respect to the latter, Canada's public and business life will for the future be surrounded by a more wholesome atmosphere.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., March 29, 1915.**—Industrial conditions during the last week have been much as usual. No events of note have transpired outside of those which are directly or indirectly connected with the shell business. Large orders of shells from the Russian Government have been received, and, on account of these orders, certain lines of machine tools have been exceptionally active. Pig iron has not moved to any extent nor is there much likelihood of any change in the immediate future. Copper is a little stiffer in price, and the price of tin has dropped a little, owing to the supply in New York being a little easier.

### The Steel Trade.

The steel trade is rather quiet as far as railway supplies are concerned. It is officially announced by the Canadian Car & Foundry Co. that their recent order from the Russian Government is considerably in excess of thirty million dollars, which amount was mentioned in the local papers. It is also understood that the delivery must be made within ten months. The forging plant from the Western plant has been removed to Montreal and active arrangements are being made to start immediately on this work. Of course, the Canadian plant, vast as it is, cannot commence to handle

this work alone. Portions of the contract will be sub-let both in Canada and the United States.

The Hull Steel and Iron Foundry have recently installed in their new shops a steel converter of Belgian manufacture, and are able to make steel castings up to several tons in weight. Castings of steel to any analysis can be obtained and there is no doubt that this firm will make a big bid for work in the future. The Algoma Steel Co. expect to start up their merchant bar mill about April 1st. This mill has not been running for some time.

**Pig Iron.**

Pig iron is not moving in any volume, the little business done being of the hand-to-mouth variety. Prices remain much the same.

**Machine Tools and Supplies.**

The impetus created in the turret lathe and small machine tool trade has been again stimulated by the placing of new orders for shells. With more determination than ever, dealers and manufacturers are endeavoring to meet the increased demand. Attachments and tools for standard machine tools make a strong showing on the market, and many ingenious methods and devices have been unearthed in a remarkably short period of time.

The supply business is increasing daily and the quality of supplies is of the very best, hence this business is one that cannot be overlooked.

**Metals.**

Contrary to expectations, the price of copper has gone up slightly. From all quarters a decline was expected. The tin situation is easier. British shipments from London have had a tendency to make matters better in New York. Lead is a trifle stiffer. The scarcity of antimony has made itself evident again by the increase in price of one cent a pound. Aluminum is unchanged. Canadian prices are all higher than American owing to the war tax and difficulty of financing.

---

**Toronto, Ont., March 30, 1915.**—A better feeling is noticeable in business circles, and confidence is gradually returning. Although the volume of trade is by no means normal, it is very fair, considering the prevailing conditions. One desirable feature about the present industrial depression is the effect which it has had in eliminating, to a great extent, speculation. It has also proved the necessity of a more careful management of commercial undertakings. Conservation of capital is essential under present financial conditions, although money is not as tight as it was at the beginning of the year. The majority of engineering works are actively engaged in the production of shells or parts of shells, and but for this many plants would be practicalyy idle. Good progress is being made in this special industry, and the firms interested are rapidly adapting themselves to the new class of work. The output of shells is increasing each week, and with a practically unlimited demand, production should soon reach a high figure.

**Steel Market.**

Conditions in the steel trade are gradually improving, although business is not very brisk. The building trade is showing very little improvement, notwithstanding the fact that the season is now sufficiently advanced to permit of greater activity in operations. A few specifications for steel pipe for waterworks systems have been issued, and there is a better movement in structural shapes for bridges. The demand for round bars for lyddite shells is increasing, and some nice business is anticipated, as the plants for making these shells become equipped. The only price change to note this week is in cold drawn steel shafting. A new list has been issued, and the discount is now 40 per cent. at mill or warehouse. Quotations on steel products are firm.

Sentiment is improving in the States, and the volume of business is increasing. The heavy demands for rounds for shells for the Allies has caused considerable strength in the steel bar market. All markets are firm.

**Pig Iron.**

There is nothing of particular importance to note in the pig iron market. The demand continues light and quotations unchanged.

**Scrap Metals.**

The market is dull, with light demand. Quotations are unchanged, but firm.

**Machine Tools.**

Considerable activity continues in the market, and the demand for tools is almost entirely for shell-making equipments. The demand for machines for this purpose is so heavy that great difficulty is being experienced in obtaining satisfactory deliveries. Several United States' concerns have booked large orders from the Allies for shell machinery, and as some of these firms are also selling tools in this market, deliveries are naturally affected.

**Supplies.**

The supply business continues to improve and the market is steady. Prices are firm and unchanged except for linseed oil, which has declined 4c, due to a break in the flax seed market.

**Metals.**

Business is steadily improving, but consumers are cautious and buying in small lots. The markets have a weaker tendency. tin and spelter having declined; in both cases, however, quotations are more or less nominal. Other markets are quiet, but firm.

**Copper.**

The copper situation is unchanged and the British Government has practical control of all shipments of this metal from the United States to Europe. The market is quiet, but firm, and quotations are unchanged.

**Tin.**

The market is recovering after a heavy decline in London, but business is dull. The congestion at the London docks and scarcity of shipping is an important factor in the situation, and there is no relief in sight. The market is weak and quotations have declined to 54c, which is more or less nominal.

**Spelter.**

The market is stagnant and very irregular. The situation has not improved with regard to obtaining prompt shipment. Spelter quotations are nominal at 13c per pound.

**Lead.**

The market is quiet, but very strong, with a possibility of higher prices. Quotations are unchanged at 5¾c per pound.

**Antimony.**

The market continues quiet at unchanged prices. Quotations are nominal and unchanged at 25c per pound.

**Aluminum.**

There is no change in prices, which are firm at 23½c per pound.

---

**Transformer and Switch Oils.**—Transformer and switch oils are very little understood by the average engineer, states the Vulcan, and many of the heating troubles experienced are due, not to the apparatus, but to the oil, as a very small amount of adulteration may cause trouble. Moisture, even to the extent of five or six drops of water per quart of oil, reduces the insulation by about 25 per cent. Sulphur, resin, acid and alkali, which are found in some oils, also have a very bad effect, while the formation of carbon and sludge takes place even in the best oil. The way to avoid these troubles is to buy the oil to strict specification, and to have it properly tested before use. Tests at frequent intervals should also be made, while the tanks should be cleaned out at least once every year, and the oil changed, or at least filtered, at the time.

---

THE reason so few people get what they want is because they don't want it hard enough to use real effort in bringing things their way.

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

## Engineering

**Thorold, Ont.**—The Beaver Board Co. propose to buy additional equipment for the power plant.

**St. John, N.B.**—Messrs. Eagles, Hogan & Sterling, all of this city, will establish a brass foundry here.

**Seaforth, Ont.**—The Bell Engine Works has received a contract from the Government for the manufacture of shells.

**Moncton, N.B.**—The Record Foundry and Machine Co. has received an order for lyddite shells from the Shell Committee.

**Winnipeg, Man.**—A by-law is being considered by the City Council to raise $35,000 for establishing a municipal machine shop.

**Sarnia, Ont.**—The Sarnia Metal Products Co., which has recently completed its plant, will start operations in a few days. Lloyd Lott is sales manager.

**Charlottetown, P.E.I.**—The foundry and blacksmith shop of the Bruce Stewart Co., were destroyed by fire on March 20. The damage to the buildings and machinery is estimated at $10,000 with $5,000 insurance.

**Tara, Ont.**—John S. Clark, of Paisley, has gone into partnership with John Foster, of Walkerton, and purchased the Gerolamy foundry in Tara. Mr. Clark was formerly with the Goldie & McCulloch Co., of Galt.

**St. Thomas, Ont.**—M. R. Bump, chief engineer of the Southern Ontario Gas Co., recently made a report to the head officers, with respect to the installation of a purification plant for Tilbury natural gas at Glenwood. Mr. Bump points out in the letter that the results obtained have been very gratifying, and he believed that they are now in possession of the necessary information to enable them to complete a plant with sufficient capacity to handle all of the gas necessary to supply the needs of the company.

**Hamilton, Ont.**—The Franklin Steel Works of Joliet, Ill., has decided to locate a branch factory in Hamilton for the manufacture of toe calks for horse shoes. Incorporation has been applied for with a capital stock of $40,000, the new concern to be known as the Franklin Steel Works, Ltd. A factory that formerly was part of the old plant of the Laidlaw Bale Tie Co. has been leased. W. F. Pitcher, of the Franklin Steel Works, Joliet, Ill., will be treasurer and manager of the Hamilton branch.

## Electrical

**Toronto, Ont.**—The Board of Control will purchase 6,000 hydro lamps.

**Toronto, Ont.**—The Toronto hydro-electric will purchase a number of new type lamps for the city bridges.

**Victoria, B.C.**—The City Council propose to install a fire alarm system at an estimated cost of $12,500. Clerk, W. J. Dowler.

**Sarnia, Ont.**—Engineers Jeffrey and Lawlor, of the Hydro Commission, have arrived here and have commenced collecting data necessary to make estimates of the cost of a distributing system for Sarnia. An effort is being made to get the Sarnia Electric Company to work with the Commission's engineers in making a valuation of their system.

## Municipal

**Welland, Ont.**—The council has voted $25,000 for the Welland Hydro Commission.

**Galt, Ont.**—The by-law to raise $11,000 for a fire alarm system was defeated on March 26.

**Trenton, Ont.**—Extensions are contemplated to the waterworks distribution system.

**Quebec, Que.**—The City Council is contemplating extensions to the waterworks system.

**Toronto, Ont.**—The city has obtained the necessary power to spend $12,000 on waterworks improvements.

**Huntsville, Ont.**—A by-law is contemplated to raise $12,000 for a new firehall and electric light equipment.

**Berlin, Ont.**—A by-law to raise $6,000 for water extensions is contemplated by the Water and Light Commission.

**Transcona, Man.**—Tenders will be called shortly for two 6-in. centrifugal sewage pumps. Engineer, W. M. Scott, Winnipeg.

**Toronto, Ont.**—The city has obtained power from the Provincial Legislature to spend $70,000 for the Strachan Ave. bridge, and $11,000 for a bridge at Crawford street.

**Toronto, Ont.**—The Street Commissioner has recommended that the Canadian Griscom-Russell Co., Montreal, be awarded the contract at $49,200 for a Sterling incinerator.

**Chatham, Ont.**—The city engineer has submitted a plan and estimate of the sewage disposal system. The report has been referred to the Provincial Board of Health for their approval.

**Bracebridge, Ont.**—The following by-laws will be voted on by the ratepayers on April 12: $4,000 for new pumps; $2,700 for water main extensions; $5,300 for waterworks extensions.

**Toronto, Ont.**—The Board of Control has decided to purchase additional apparatus, including an aerial truck, combination chemical and hose wagon and two motor trucks for the fire department.

**Peterborough, Ont.**—The City Council will enter an appeal against the Board of Arbitrators' award of $154,615 as the price the city shall pay for expropriating the Peterborough Light & Power Co. plant.

**Mimico, Ont.**—Aird Murray & Lowes, engineers of Toronto, will inspect the New Toronto water system, estimate the cost of a connection with Mimico and ascertain if the system is capable of supplying this town.

**Walkerton, Ont.**—Two by-laws will be voted on by the ratepayers on April 15. The first is to raise the sum of $3,500 for the construction of the 100-foot span to the west end bridge, and the second to raise the sum of $5,000 to extend the waterworks system.

**Toronto, Ont.**—Mayor Church announced last Monday that the new civic car lines on Lansdowne avenue and Mount Pleasant road would be started as soon as the frost is out of the ground. More cars and equipment for civic lines, to cost $100,000, are to be secured.

**Montreal, Que.**—The City Council has refused to vote $250,000 for the construction of the municipal library before they are made acquainted with the material to be used in the building, the

name of the contractor, etc. The building will cost, if the lowest tender is accepted, $466,000.

**Brockville, Ont.** — The recommendations of the joint civic committees for the improvement of Brockville's water supply will be forwarded to the Provincial Board of Health for approval, and if found satisfactory steps will be taken for the immediate installation of a filtration plant at the pumping station. It is proposed also to extend the intake pipe and divert the sewage outlet so that it will not contaminate the water supply.

## General Industrial

**Owen Sound, Ont.**—The McQuay Tanning Co. will build an addition to their plant.

**Coatsworth, Ont.** — The Coatsworth Brick and Tile Co. will probably make extensions to their plant.

**Winnipeg, Man.**—It is reported that a factory to manufacture "cream of wheat" will be established here by a Minneapolis concern.

**Ingersoll, Ont.**—It is announced that the Borden Condensed Milk Co. will make additions to their plant costing $60,000. R. B. Hutt is superintendent.

**Lindsay, Ont.**—An effort is being made to amalgamate the Lindsay Office Fittings Co., with the Capital Office Supply Co., of Ottawa. Peter Kennedy, of Lindsay, is interested in the deal.

**Lindsay, Ont.**—Plans have been prepared for a new factory for Horn Bros. Woolen Co. It is stated that the building will cost over $45,000 and the machinery $55,000. The old factory was destroyed by fire some time ago.

## Contracts Awarded

**Granby, Que.**—The Imperial Tobacco Co. has awarded a number of contracts for the new powerhouse to be erected here.

**Toronto, Ont.**—The Board of Education has awarded a contract for electrical fixtures for the new Technical School to Keith's Ltd., of Toronto. The contract amounts to $9,960.

**The Pas, Man.**—The contract for the steel cantilever across the Nelson River, at Manitou Rapids, on the Hudson Bay Railway, has been let to the Canadian Bridge Co., Walkerville, Ont.

**Calgary, Alta.**—Contracts have been awarded for storage battery materials in part to the Canadian General Electric Co., for $2,058.66, and in part to General Supply Co., Ottawa, for $550.

**Ottawa, Ont.**—The City Council have awarded the contract for the supply of 12-in. water-mains to the National Iron Works, Ltd., Toronto.

**Saanich, B.C.**—At a meeting of the city council held recently the contract for the supply of cast iron piping and special castings was given to Balfour, Guthrie & Co. The tender of Balfour, Guthrie & Co. quoted prices of $36.81 per ton for the piping, and $74.29 per ton for the special castings, making the amount of the contracts $139,841 and $9,060 resepectively.

**Toronto, Ont.**—The Board of Education has awarded the following additional contracts for equipment at the new Technical School: Forge fan to the Canadian Sirocco Co., Windsor, Ont., for $877; laboratory switchboards to the Canadian Westinghouse Co., Hamilton, for $1,315; lockers to the Dennis Wire & Iron Goods Co., London, Ont., for $4,050; printing presses to the Toronto Type Foundry Co., Toronto, for $4,200.

**ALLIES PURCHASING AGENTS.**

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**British—Col. A. G. Barton and A. C. Billing, Ritz Carlton Hotel, Montreal.**

**French—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**

**Russian — Messrs. S. Ruperti and Aiekieff, care Military Attache, Russian Embassy, Washington, D.C.**

## Tenders

**Hamilton, Ont.**—Tenders will be received by the Board of Control, up to Tuesday, April 6th, 1915, for the following:—520 feet of reinforced concrete pipe, 4 feet 6 in. diameter; 540 feet of reinforced concrete pipe, 4 feet 3 in. diameter; 495 feet of reinforced concrete pipe, 3 feet 3 in. diameter; 600 feet of reinforced concrete pipe, 2 feet 6 in. diameter, for the construction of a sewer on Gertrude Street; also for 770 feet of reinforced concrete pipe, 2 feet 6 in. diameter, for the construction of a sewer on Burlington Street. Specifications and form of tender may be had upon application to A. F. Macallum, C.E., city engineer.

## New Incorporations

**The Inland Power and Traction Co.** of Fort George, B.C., has been incorporated with a capital of $25,000.

**The Gas City Brick Co.** has been incorporated with a capital of $300,000 to carry on business at Medicine Hat, Alta.

**The Doone Tractor Co.** has been incorporated with a capital of $40,000 to carry on business at Winnipeg, Man. Incorporators: J. H. Green, E. R. Chapman and F. L. Quance of Winnipeg.

**Beaver Mica Mining Co.** has been incorporated at Ottawa, Ont., with a capital of $50,000 to develop mines, minerals and manufacture mica, etc., at Ottawa, Ont. Incorporators: P. H. Chabot, A. J. O'Brien and F. W. Ward, all of Ottawa, Ont.

**The Canadian Regal Motor Co.** has been incorporated at Toronto, Ont., with a capital of $100,000 to carry on the business of manufacturers of automobiles, etc., at Berlin, Ont. Incorporators: H. Nyberg, A. H. Millar and L. K. DeBus, all of Berlin, Ont.

**Kelly, Powell, Ltd.**, has been incorporated at Ottawa, Ont., with a capital of $50,000 to manufacture railway contractors' mining and municipal supplies at Winnipeg, Man. Incorporators: J. T. Kelly, E. G. Powell, of Winnipeg, Man., and H. J. Trihey, of Montreal, Que.

**The Canadian Blower & Forge Co.** has been incorporated at Ottawa, Ont., with a capital of $500,000 to manufacture heating, ventilating and drying apparatus, fans, etc., at Berlin, Ont. Incorporators: W. F. Wendt, H. W. Wendt and J. M. Chipman, all of Buffalo, N.Y.

**Rubber Regenerating Co. of Canada, Ltd.**, has been incorporated at Ottawa, Ont., with a capital of $200,000 to regenerate and reclaim rubber and rubber by-products at Montreal, Que. Incorporators: C. Macpherson Holt, E. M. McDougall and G. S. Stairs, all of Montreal, Que.

## Personal

**Alexander Kirkaldy** has been appointed chief engineer for the new Technical School at Toronto, by the Board of Education.

**H. A. Bayfield** has been appointed by the Dominion Government to the position of principal assistant engineer at the Fort Nelson terminus of the Hudson Bay Railway.

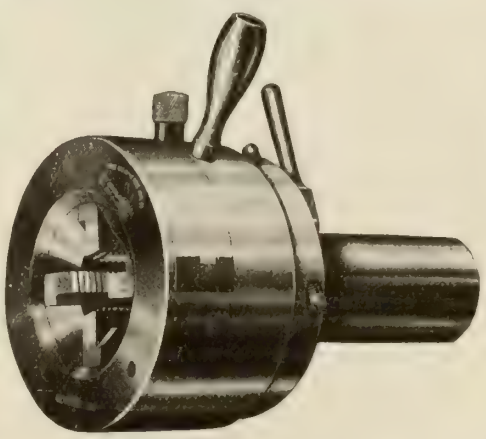
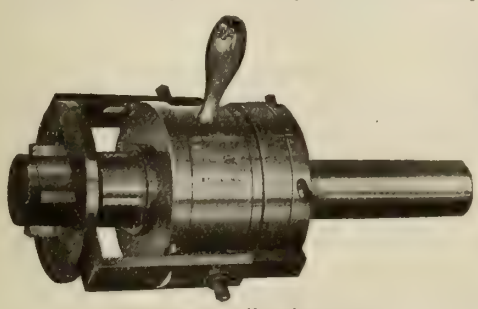
# Here Are Tools That Help to Perfect Shrapnel Shells

**Geometric Self-Opening Die Heads and Collapsing Taps Give True, Clean Threads Always**

Therefore, when the demands of Shell Making became urgent, they were ready for the closest test.



Geometric Self-Opening Die Head



Geometric Collapsing Tap

Every owner of a Screw Machine or Turret Lathe using Geometric Threading Tools knows that no one is better equipped for threading, not only Shells, but every part that requires a Screw Thread.

Self-opening Die Heads for cutting 1-16-inch diameter and up to the largest diameter required.
Collapsing Taps for tapping any diameter above ¾-inch.
OUR STANDARD:—Finest Quality, Greatest Quantity, at Least Outlay.

**Catalog upon request.**

## The Geometric Tool Company, New Haven, Conn., U.S.A.

Canadian Agents:
**Williams & Wilson, Limited, Montreal. The A. R. Williams Machinery Co., Limited, Toronto, Winnipeg, St. John, N.B.**

*If what you want is not advertised in this issue consult the Buyers' Directory at the back.*

**A. J. Somerville**, for some time president of the Ontario Lead and Wire Co., died at Toronto on March 28. Mr. Somerville was born at Huntington, Que., in 1844, and came to Toronto some 40 years ago.

**Charles J. Phoenix**, assistant to W. D. Muir, manager of the steel department of the Steel Company of Canada, Ltd., Hamilton, has left to join the staff of the Algoma Steel Corporation, Sault Ste. Marie, Ont.

**Richard James**, who for the past few years has been the Montreal manager of Beauchemin & Fils, Ltd., manufacturers of steel castings, has severed his connection with that firm and will in future act as a manufacturers' agent dealing in iron and steel castings, machinery, foundry and power supplies. His address is 55 Cote street, Montreal.

**Jabez G. Twiton**, secretary-treasurer of the Australasian branch of the Massey-Harris Co., of Toronto, died March 18, at Melbourne, Australia, from injuries received in a motor accident. He was 62. He entered the service of the Massey-Harris Co. in 1884, and five years later was transferred to Melbourne to take charge of the company's Australian business.

**Frederick Winslow Taylor**, a well known engineer, died at Germanstown, Pa., on March 21, aged 59 years. The late Mr. Taylor was the pioneer of scientific shop management and methods, and he devoted the greater part of his career to the study and application of his theories. His work has been of a far-reaching character, and has revolutionized factory management. Mr. Taylor collaborated with Maunsel White in the discovery of the Taylor-White process of heat treatment.

**Alex. Taylor**, of Toronto, formerly assistant secretary, has been appointed secretary of the Lake Superior Corporation, the Algoma Steel Corporation, and the subsidiaries of these concerns. Mr. Taylor succeeds Thomas Gibson, who recently resigned, and is now president of the Lake Superior Corporation, succeeding Mr. Frater Taylor of Sault Ste. Marie, who, however, retains the presidency of the Algoma Steel. Mr. Taylor has also been added to the board of the Lake Superior Corporation.

## Trade Gossip

**Darling Bros., Ltd.**, Montreal, have been awarded the contract for the installation of elevators in the Martin Senour Paint Co.'s factory.

**Lecky & Collis, Ltd.**, of Montreal, have been appointed sole agents for eastern Canada for the hoisting engines, etc., manufactured by the Doty Marine Engine and Boiler Co.

**The Otis-Fensom Elevator Co.**, Hamilton, has been awarded contracts for the elevators at the Immigration Building, Vancouver, B.C., and the Customs House at Port Arthur, Ont., by the Department of Public Works.

**Can. Fairbanks Board.** — The only change in the Board of Directors of the Canadian Fairbanks-Morse Co., which took place at the annual meeting held on March 24 at Montreal, was the retirement of C. H. Morse, sen., who was succeeded by his son, Robert Morse. The Board is now as follows:—Henry J. Fuller, president; Thos. McMillan, P. C. Brooks, and C. G. Drinkwater, vice-presidents; E. R. Whitehead, treasurer; C. H. Morse, jun., H. C. McClary, W. E. Miller and Robert Morse, directors.

**Hydro-Electric Plans.**—The middle of the summer will, it is understood, see the completion of plans now being made by the Provincial Hydro-Electric Commission for the securing of a new supply of power. The commission is faced with the prospect of exhausting its present contract for 100,000 horse-power, and is weighing alternative propositions—the the purchasing of additional power along the lines now followed, or the widening of the policy of developing its own power initiated with the Wasdell's and Eugenia Falls plants. For nearly a year past the engineers of the commission, acting under the direction of Sir Adam Beck, have been at work upon investigations and estimates for the development of power at the Niagara River, and from the spillways of the Welland Canal. It is believed that both developments will be practicable.

## Catalogues

**Counting Machines** made by the C. J. Root Co., Bristol, Conn., are described in a folder just to hand. The cuts give a general idea of these machines and the reading matter states for what purposes they can be used.

**Elevator Buckets.**—The Jeffrey Mfg. Co., Columbus, Ohio, have recently issued a new 19-page bulletin and price list No. 143, giving complete information about their standard line of malleable and steel elevator buckets. Copies will be sent to interested persons upon request.

**Search Light Projectors** made by Enberg's Electric and Mechanical Works, St. Joseph, Mich., are described fully in a bulletin recently issued. This type of projector is designed for installation in the pilot house or on deck, and the principal features of each type illustrated are dealt with. A table is included giving the principal dimensions, weights, etc., of each type.

**Universal Center Grinders** made by the Hisey-Wolf Co., Cincinnati, Ohio, are illustrated and described in bulletin No. 1102. These grinders are designed to operate on either direct or alternating current for any frequency ranging from 25 to 60 cycles. The new features of these tools are described and tables are included containing the principal dimensions and other data on each type.

**Flag Calendar.**—We have received from the Lighthouse Literature Mission, Belfast, Ireland, a copy of their 1915 Calendar, the feature of which is an illustrated layout of the new International Code Flags. A scroll heading giving the Mission designation and setting forth its purposes, together with a neat and easily legible "tear-off" monthly date panel serve to complete a useful and highly artistic production.

**Frank & Sons Calendar.**—The 1915 calendar issued by Frank & Sons, marine and engineering photographers, South Shields, England, comprises a series of representative vessel photographs in black and white, and a monthly "tear-off" date pad pleasingly and artfully arranged. The vessels illustrated include the "Aquitania," the "City of Exeter," the "Varela," and a torpedo boat destroyer, all of them being under steam.

**Pump Governors.**—Bulletin J. recently published by the Elliott Co., Pittsburgh, Pa., is one of a series dealing with high grade power accessories and is devoted to a description of the various types of pump governor which they make. Each type is fully described and the illustrations, some in section, show clearly the principal features embodied in their design. A series of tables give the chief dimensions and other particulars of each size.

**Thornycroft Calendar.** — John I. Thornycroft & Co., Caxton House, Westminster, London, England, give evidence of the war spirit dominating all of us at the present time, and particularly the naval phase of it in their current year calendar. H.M.S. Lance, torpedo boat destroyer, ploughing through a sea, is the prominent feature, while illustrations of a motor wagon and motor boat together with a "tear-off" monthly date pad, round out an attractive and especially appropriate publication.

**Generating Sets.**—Enberg's Electric & Mechanical Works, St. Joseph, Mich., have sent us a copy of bulletin No. 24, describing the "Enberg" dynamos and engines. The generating sets dealt with in this bulletin are vertical, direct connected type from 2½ to 50 k.w. for

# AMMUNITION

**We have for immediate delivery the following machine tools, carefully selected, rebuilt and in first-class condition, many being particularly adapted to the manufacture of shrapnel:—**

**DRILLS—UPRIGHT AND SLIDING HEAD.**

20″ Aurora Cone Drive H. W. & L. feed (2).
20″ Mechanics 2 spindle H. W. & L. Plain (1).
32″ Cincinnati Sliding Head Belt Feed (2).
32″ Aurora Sliding Head Belt Feed (2).
32″ Pond Sliding Head Belt Feed (3).
42″ Aurora Sliding Head Belt Feed (2).
2 style "F" 20″ Baker High Speed Drills (2).

**GRINDERS.**

No. 1 Leland & Faulkener Wet Tool 1 and 2 wheels (1).
24″ Wet Tool.
36″ Wet Tool.
No. 2 Worcester Drill (2).
Double Wheel Foundry (1).
5—small Grinder Stands, 10″ and 12″ wheels (2).
No. 200 and No. 210 Heald Ring and Surface (1).
Le Blond Universal Tool and Cutter (1).
No. 3 Osterlien Universal Tool and Cutter (1).
No. 3 Landis Universal (3).
6—6″ x 32″ Norton Plain (1) and (2).
No. 11 Brown & Sharpe Plain 5″ x 30″ (2).
10″ x 36″ Landis Plain (3).

**LATHES.**

6 assorted size Speed Lathes (2).
5—14″ x 6′ Prentice C. R., cone drive, belt feed (2).
14″ x 6′ Flathers Tool Room (1)
16″ x 6′ Flathers P. R. and chucks (2).
16″ x 6′ Flather P. R. and chucks (2).
16″ x 6′ Davis C. R., belt feed (2).
18″ x 8′ Lodge & Davis, old, C. R., T. A. (2).
18″ x 8′ Reed Plain Rest, belt feed (2).
18″ x 14′ Lodge & Davis, C. R., Chuck, belt feed (2).
20″ x 12′ Johnson, Gear Feed, C.R., T.A., and chuck (3).
20″ x 12′ Pond, old, C.R. and chuck (3).
20″ x 10′ Walcott & Wood, C.R., belt feed and chuck (2).
22″ x 16′ Pond C. R. old style (2).
36″ x 20′ Pittsburg Triple Geared C.R. two carriages (2).
39″ x 9′ Roll Turning Lathe (1).
48″ x 18′ Pittsburg Triple Geared C.R. (2).
50″ x 18′ Fifield Triple Geared C.R., chuck (1).
52″ x 36′ Hewes & Phillips Triple Geared (3).
64″ x 43′ Hewes & Phillips C. R., T. A., arranged for countershaft work (2).
64″ x 43′ Roach Heavy Forge Engine Lathe, triple geared (3).

**LATHES—(Continued).**

120″ x 43′ Pond Crankshaft Turning Lathe with equipment (2).

**MILLING MACHINES—PLAIN AND UNIVERSAL.**

No. 2 Cincinnati Belt Feed Plain (2).
No. 2 Brown & Sharpe Heavy, plain and slotting attachment (1).
No. 3 Brown & Sharpe Universal complete (2).
No. 3 Cincinnati Plain Belt Feed (2).
No. 4 Cincinnati Plain Gear Feed (2).
No. 4 Blake & Johnson Vertical 36″ x 14″.
No. 5 Becker Vertical & Table (2).

**TURRET LATHES AND SCREW MACHINES.**

No. 2 Pratt & Whitney Plain (2).
No. 2 Bardons & Oliver, Wire Feed (1).
2—No. 2 Warner & Swasey, wire feed and equipment (1).
No. 2 Brown & Sharpe Automatic, wire feed, equipment (1).
No. 2 Brown & Sharpe Plain Head (2).
No. 2 Foster Plain Head (2).
No. 3 Bardons & Oliver, Plain head, wire feed (2).
No. 3 Pratt & Whitney, Plain head, wire feed (2).
1—1½″ Dreses Plain Head, wire feed, power turret feed.
1—¼″ Davis & Eagan, wire feed, plain head (3).
No. 4 Bardons & Oliver Automatic Chuck, power turret feed, friction head, cross feed (1).
No. 4 Bardons & Oliver, same, with plain chuck head (1).
3—2″ x 24″ Jones & Lamson Cone Head Flat Turrets (2).
4½″ x 30 Bardons & Oliver, stock, feed geared head motor drive (2).
24″ Davis Chucking Lathe (2).
24″ x 10′ Lodge & Shipley Heavy Turret Lathe, 3½″ spindle (2).

**AUTOMATICS.**

3—⅞″ Cleveland Automatics (2).
2—1¼″ Cleveland Automatics (2).
1¼″ Gridley Single Spindle (1).
4 spindle Acme Automatics, ⅝″ capacity (2).
9″ x 14″ Gridley Piston Ring Machine.

**The above are a few of our stock tools. We have all kinds of metal-working machinery in our Cleveland warehouse.**

marine or land purposes. A detailed description covering their construction is given accompanied by illustrations showing the details and sectional views. Tables are included giving the weights and principal dimensions of each size.

**Refrigerating Machinery.** — A new booklet has been issued by the York Mfg. Co., York, Pa., principally for use in connection with the Panama-Pacific Exposition. The book illustrates and describes a varied line of ice-making and refrigerating machinery, including various types of ammonia compression machines and absorption plants from one-half ton refrigerating capacity upwards. This attractive booklet may be obtained from the Canadian representatives, the Canadian Ice Machine Co., 82 Chestnut street, Toronto.

## Book Reviews

**The Institution of Gas Engineers' Transactions for 1914** have been published by E. & F. N. Spon, Ltd., London, England. In addition to the ordinary routine matter, the report contains a number of interesting papers on subjects pertaining to gas engineering read at the annual meeting held last June.

**National Electric Light Association.**— The report of the thirty-seventh annual convention, held at Philadelphia, Pa., in June, 1914, has recently been published. The report comprises four volumes, and contains the papers, reports and discussions at the sessions, classified in the various sections, such as general, commercial accounting, hydro-electric and transmission.

**Factory Power and Costs** by Joseph G. Branch, 43 pages, paper covers. Published by the Joseph G. Branch Publishing Co., Chicago, Ill. List price 50 cents. This booklet is the latest published by the author and is a collection of editorials published in "Electricity and Engineering." The booklet contains a considerable amount of interesting matter regarding factory and machine shop drives and the application of power to the best advantage. There are six chapters in the volume and enumeration of the titles will serve to indicate the subjects covered. Chapter I. deals with labor and costs; chapter II. with power costs; chapter III. power distribution losses; chapter IV. power required for machine tools; chapter V. prime movers. The concluding chapter VI. is entitled "Steam still King," from which it will be inferred that the author believes in the supremacy of steam power over other sources of energy. This is essentially a practical booklet, and contains many useful suggestions for the consideration of superintendents or mechanics.

## FOR SALE

FOR SALE — A LARGE ASSORTMENT second-hand wood pulleys, cast iron pulleys and hangers, to clear at half-price. Toronto Type Foundry Co., Limited, 70 York St., Toronto.

PRESSES—ALL TYPES
Press Attachments, Automatic.
Metal and Wire Forming Machines.
Tumblers—Large Line.
Burnishing Machines. Grinders.
Special Machines.
Baird Machine Co., Bridgeport, Conn.

20 TIMES THE SERVICE
That's what this self-hardening, high-speed steel chaser does for the LANDIS DIE. Four long cutters tangentially disposed to the work carried in suitable holders make an ideal cutting condition. This, along with its many other distinctive characteristics, has established for us a world-wide reputation.
WRITE FOR CATALOGUE NO. 21.
Landis Machine Co., Waynesboro, Pa.
Exclusive Canadian Representatives, Williams & Wilson, Montreal, Canada.

Detective and Stop Watch Combined.
"We have a counter on every one of our presses, even the foot presses." This from a satisfied user of our counters. If you use presses our counters would save you money. Ask for catalog 25.
The C. J. ROOT CO., 125 Bridge Street, Bristol, Conn.

# PERFORATED METALS

Write to us regarding your Tool Room partition problems. We can save you space and light.

We make any size perforation in any kind of metal required.

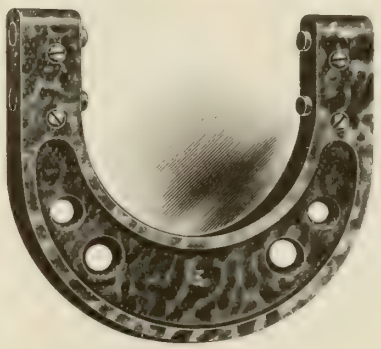
*Little Giant*

# Cylindrical Limit Gages

## For Shells and Shrapnel



### Crescent Gage

This gage is peculiarly adapted to the accurate measuring of outside diameters of Shells and Shrapnel as well as other cylindrical work.

The upper points are set to the maximum limit—the lower points to the minimum limit. These can be sealed to prevent tampering.

### One gage does the work of two

with all the consequent saving of time and labor.

Points are of tool steel, hardened and ground.

**We are also prepared to quote prices on special gages for Shell Work. Write us about your requirements.**

# CENTER GRINDER

(Improved)

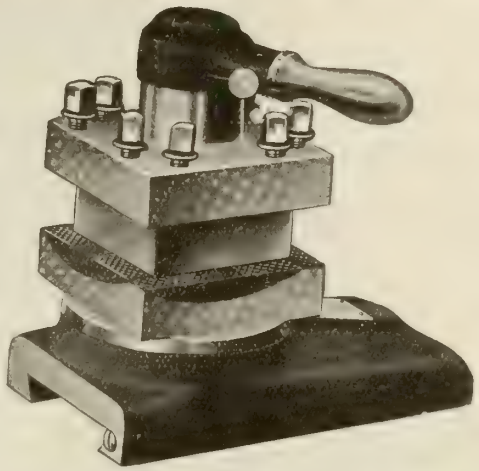
**CHEAP! PRACTICAL! DURABLE!**

The most popular tool of its kind on the market. Adjusted in a moment. An occasional use will keep your Lathe centers in perfect order.

## Stow Mfg. Co.

**Binghamton, N.Y., U.S.A.**

Chicago Office, 106 So. Jefferson St.



## Particularly Adapted to the Manufacture of Shrapnel

**Four-Sided Tool Posts Multiply Lathe Production**

Don't stick to the old-fashioned, single tool post, but insist on having your lathe equipped with Fay & Scott patented type. We supply all lathe dealers.

*New Booklet, just out. Yours for the asking.*

## Fay & Scott, Dexter, Me.

# A PENNY SAVED IS TEN CENTS EARNED

**A penny EARNED is one cent GROSS profit. But a penny SAVED is ALL NET. That's why it pays to save.**

For a source of unusual savings, look into the question of Files. See if your men are using **inefficient** files. Working with worn files that have ceased to do good work.

Every such file you find in service may mean many dollars lost. For beyond a certain point, a file's best efficiency is gone. It then requires so much time to perform a given task, that it's real ECONOMY to throw it away. To replace it with a new file—at once. What you thus save in time and labor would pay for many new files of the "Famous Five":

## KEARNEY & FOOT
## GREAT WESTERN
## AMERICAN
## ARCADE
## GLOBE

(MADE IN CANADA)

They reflect the facilities of 5 great plants. The precision of costly automatic machinery. The economy of a 60,000,000 yearly output. The uniformity of complete control in every process. The perfection of rigid inspections and practical tests. The wide range of 4,000 different patterns. The unvarying high quality that won—and now holds 90% of Canada's file trade.

The "Famous Five" will save money in your shop if you give them a single trial. They pay their way many times over in better work at lower cost.

*"File Filosophy" and our Catalog should be on your desk. Write for THEM to-day.*

WHEN you need new equipment or supplies for your machine shop

**Consult this Directory**

¶ You'll find listed here the reliable makers of the lines you need; firms who believe in the progressiveness of present-day manufacturers and who appeal to their intelligence through their own engineering journal.

¶ Consult Canadian Machinery Buyers' Directory and you can't go wrong in your buying.

**Trucks, Lumber and Kiln.**
John Inglis Co., Toronto.

# CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS--Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5.00 per line a year is charged to non-advertisers.

# OUR ELEVATING TRUCK

*is indispensable in the handling of*

# Shrapnel Shells

*or in any factory where numerous operations are required*

## OPERATION:

All material is stacked on platforms. To move material the truck is backed under the platform; the handle of the truck is then pushed down, keeping the button depressed, which raises the truck bed, and with it the loaded platform, at the same time automatically locking it in its raised position. When hauled to the desired position the button is pressed and the handle raised, lowering the platform to the floor. The truck is then drawn from underneath and is ready to move another platform.

## SIMPLICITY IN MECHANISM

Raising and lowering of the truck can be operated with one hand only—can be raised or lowered at any angle. Specially designed ball-bearings throughout.

**ANY MATERIAL THAT CAN BE STORED ON PLATFORMS OR IN BOXES CAN BE MORE ECONOMICALLY MOVED WITH THIS TRUCK THAN BY ANY OTHER MEANS.**

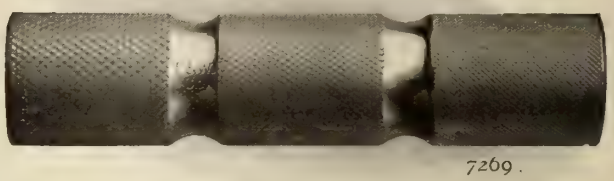
# Don't Waste Time Changing Knurls

and don't be bothered with three holders when one will do.

**Use the P. & W. "Three-in-One" Lathe Knurling Tool**

Carries three pairs of knurls, making it three distinct knurling tools in one.



**Coarse, Medium and Fine**

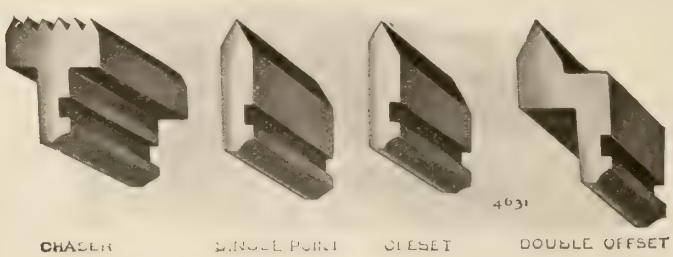
The three pitches of knurls which we carry in stock are all combined in this one tool.

Uses same knurls as regular Lathe Knurling Tool shown opposite.

# Why the P. & W. Threading Tool is Best

1. Threads can be cut very close to a shoulder.

2. Tools are sharpened by simply grinding off top of cutter.



3. Combines economy with all features essential in a threading and forming tool.

4. Cutters have 15° clearance, which experience has taught gives the longest wear in various metals.

**Write for Catalog "Small Tools" showing complete line.**

# A Page with our Readers

## Are You Missing Anything?

DO you *study* the ads. in each issue of CANADIAN MACHINERY as *carefully* as you should? Do you ever stop to think just what the advertising sections represent?

Has it occurred to you that a poor machine, a poor tool, or a poor anything, will not stand the searchlight of publicity very long?

Every advertisement in CANADIAN MACHINERY, whether large or small, is a message that cost the advertiser time, effort, and money, and what he wants to tell you about, is something that will very likely interest and benefit you. It may be about the very machine or tool that you are in need of, or will be some time in the future. It may be a safety, labor, or time-saving device that will save money for your firm, protect your men in the shop, or improve the standard of your product.

One of our readers, in sending in his renewal subscription, recently said: "The man who doesn't study the ads. is missing a great deal." Another subscriber, who is master mechanic in one of our largest plants, stated that he first became acquainted with a certain safety set screw through an eighth-page advertisement in CANADIAN MACHINERY, and had his entire plant equipped with them!

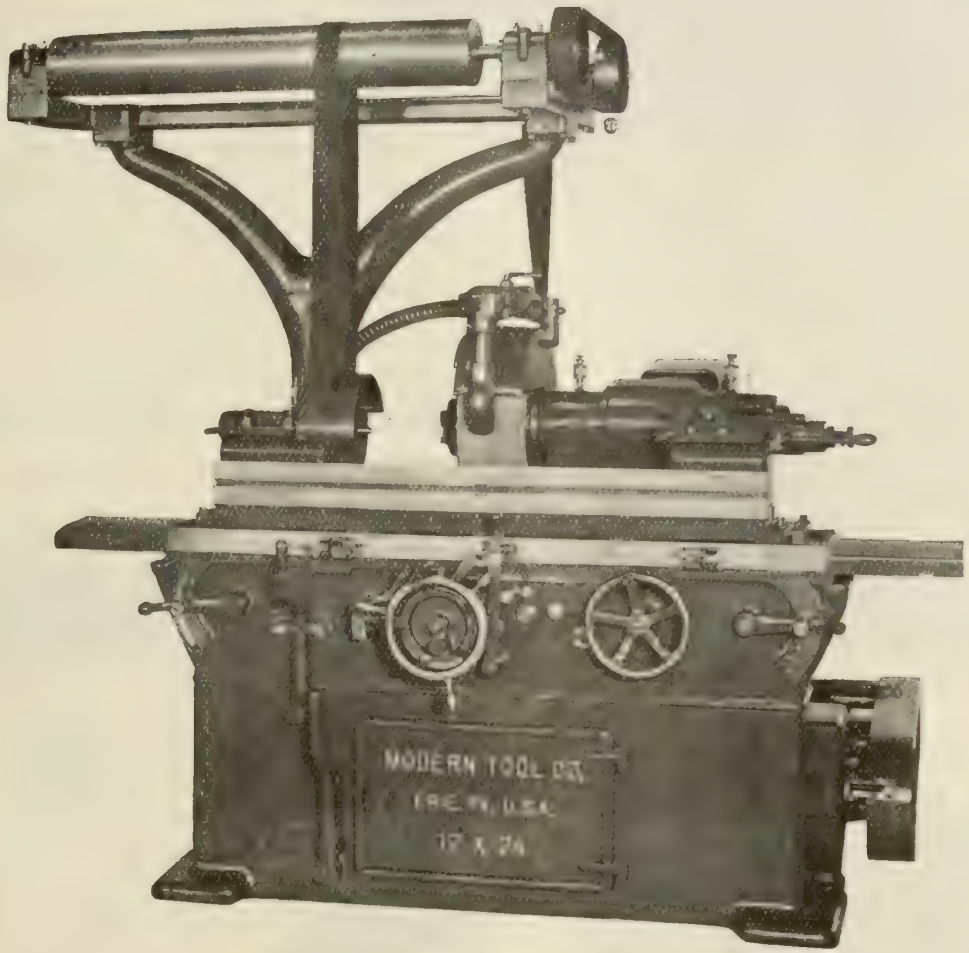
These men, and many others, rightly feel it is their duty, as mechanical officials of their plant, to study the advertising pages of this paper —to keep themselves informed as to what is latest, and best, in shop equipment.

You may be missing something good if you do not *study* the advertising pages of CANADIAN MACHINERY.

# Finishing Shrapnel Shells

ON THE

## "MODERN" 12" x 24" Self-Contained Grinding Machine



## The heaviest, most powerful and efficient Standard Grinding Machine made for Shell work

The "MODERN" 12" x 24" Grinding Machine is especially adapted for grinding Shrapnel Shells. The Machine is more than guaranteed, it is demonstrated. Large diameter, wide face wheel, with powerful drive—automatic feed without traversing the table—absolute central control of all levers and hand wheels—single constant speed drive.

We have recently sold a large number of these Machines in Canada, completely equipped for Shrapnel Work. Ask the man who is using the "MODERN."

The large manufacturer appreciates the production possible on this Machine. Machine comes equipped for all classes of straight and taper cylindrical work.

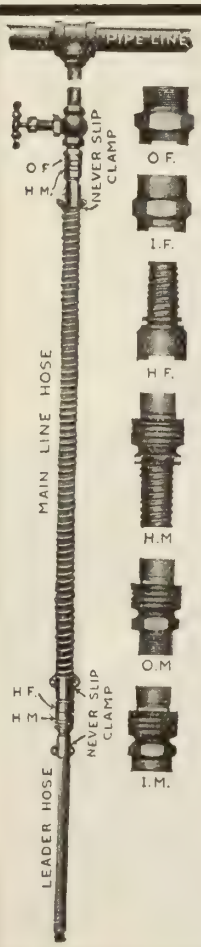
## CLEVELAND HOSE SPECIALTIES



### Bowes Automatic Air Hose Couplings

**Over 1,000,000 in general use**

**STYLE O.F.** is an Outside Thread Female Pipe End. Made in sizes ⅜-in. to 1½-in.

**STYLE I.F.** is an Inside Thread Female Pipe End. Made in sizes ¼-in. to 1½-in.

**STYLE H.F.** is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.

**STYLE H.M.** is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.

**STYLE O.M.** is an Outside Thread Male Pipe End. Made in sizes ⅜-in. to 1½-in.

**STYLE I.M.** is an Inside Thread Male Pipe End. Made in sizes ¼-in. to 1½-in.

The Male and Female Ends of Bowes Couplings interchange in sizes, ¼-in. to ¾-in. Sizes 1-in. and 1¼-in. interchange. The 1½-in. ends interchange only with themselves.

### BOWES COUPLINGS

Are instantly connected or disconnected.

They are absolutely air-tight under all pressures.

They quickly pay for themselves by stopping costly leaks.

They interchange in sizes most commonly used.

They have no loose parts to be mislaid or lost.

They are made of brass and will not rust.

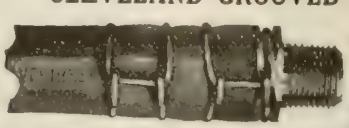
The U-shaped interchanges in couplings ¼-in. to ¾-in.

### The Cleveland Never Slip Hose Clamp

**Made in same sizes as Bowes Couplings**

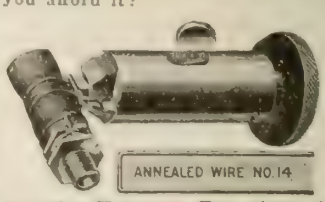
The adjoining cut of Never Slip Hose Clamp shows the "Flanges" which engages the groove provided in all hose ends of Bowes Couplings. The "Model Hose Line" illustrated shows correct styles of couplings to use and proper way to attach the clamps.

### CLEVELAND GROOVED HOSE NIPPLE



Grooved Nipples when attached to hose with the wire clamp cannot "blow out," as one-half of the Wire Clamp lies in Nipple Groove, and the other half on the hose, uniting nipple and hose permanently. "Blow outs" are expensive, as one to five men are idle while new connection is being made; time wasted, ten to thirty minutes. Can you afford it?

### WIRE CLAMP TOOL



To apply Wire Clamps to Grooved Hose Nipples you need the Wire Clamp Tool illustrated, a small hand-operated tool at moderate cost which we carry in stock for immediate delivery. In Stock: Riveting and Chipping Hammers, Four-piston Air Drills, Corner Drills, Emery Grinders, Sand Rammers, Holder Ons, Etc.

**WRITE FOR BULLETIN NO. 29.**

**IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and stop costly leaks.**

**Write for Catalog No. 12, which illustrates our complete line of Air Tools**

# Are Hack-Saws a Nuisance in Your Shop?

They *were* fast becoming a nuisance in our tool works. Men complained of saws breaking easily, dulling easily, teeth stripping, and of all the other troubles incidental to the use of hack-saws.

We did a little experimenting and made some hack-saws that we thought were pretty good. Then we did a lot of experimenting on material and processes and we made a line of saws that we *knew* were good and long trial by others as well as ourselves has convinced us that they have no equal. That is why we know that

# Starrett Hack-Saws Will Solve Your Problems

This is not the appeal of a company which must sell hack-saws to live. It is the plain statement of a company big enough and old enough to know better than claim anything which it cannot make good. We *are* sure of these Starrett Hack-Saws and we want you to try them, whether you do it because we ask you to, or because our name is on them, or because they are recommended by someone to you. Once give them a chance to prove their worth and you can forget the hack-saw situation after that, except for reordering as more are needed.

Special tungsten steel, a secret hardening process and a perfect method of setting the teeth are the reasons for Starrett hack-saw superiority.

BY INVITATION MEMBER OF

*Specify Starrett on your next order. Write for free catalog No. 203 describing 2100 styles and sizes of fine tools.*

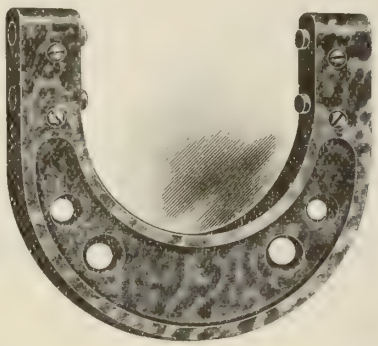
Little Giant

# Cylindrical Limit Gages

## For Shells and Shrapnel



### Crescent Gage

This gage is peculiarly adapted to the accurate measuring of outside diameters of Shells and Shrapnel as well as other cylindrical work.

The upper points are set to the maximum limit—the lower points to the minimum limit. These can be sealed to prevent tampering.

### One gage does the work of two

with all the consequent saving of time and labor.

Points are of tool steel, hardened and ground.

**We are also prepared to quote prices on special gages for Shell Work. Write us about your requirements.**

NORTON

## How Much Use Do You Make of Expert Demonstrators?

Many a manufacturer could get better production if he would utilize the expert knowledge and broad experience of the demonstrators of

## Norton Grinding Wheels

A large producer of malleable castings made an interesting test with his own workmen at the suggestion of a Norton salesman. He was using Norton Alundum Grinding Wheels and was well satisfied. But grinding wheels are being made more efficient every year and our stock of knowledge of how to increase the production in grinding operations is steadily growing.

The method of test was this:

One stock wheel and one trial wheel were put on the same spindle of a floor stand so that both ran at the same speed. The two men working on these wheels ground castings from the same pile and changed daily from one wheel to the other. Below is shown the comparative results:

| | Stock Alundum Wheel | Trial Alundum Wheel |
|---|---|---|
| Lbs. ground per hour | 309 | 315 |
| Average cost of wheel per ton of castings ground | $0.45 | $0.352 |
| Average of wheel wear per ton of castings ground | 3.148 cu in. | 2.740 cu in. |

This gain in production and decrease in wheel cost was the result of a more intensive study of the operation and the selection of a wheel better suited to the job. It needs only a word from you to secure from us the same kind of co-operation.

# Saunders' Hand Book of Practical Mechanics

By CHARLES H. SAUNDERS, Ph.B.

Is the only up-to-date Machinists' Ready Reference Pocket Book. Size 6½x4½.

**Foremen, Machinists, who have it, say they couldn't hold their job without it.**

**Can you do without the best Machine Shop Reference on the Market? Do you want to increase Your Salary and be promoted to Position of Foreman or Superintendent?**

THIS Pocket-Book Manual contains answers to tough problems, and questions that come up every day in the Machine Shop and Drafting Room; and they are all figured out by simplest methods in **arithmetic**. There are also to be found more practical **reference tables** than are contained in **all** the so-called Mechanic Hand Books bound together in one volume. Many tables and **valuable shop "kinks"** were taken right from **note-books** of the **best mechanics** in the country, **Original** Tables, Formulas, and Drawings **positively not found** in any other Pocket Manual.

A few of the tables, rules, etc., taken from index as follows:—

Table giving largest size Squares, Hexagons and Octagons that can be made out of round-stock. All the Wire and Sheet Metal Gauges, Sizes and Weights, also weight per inch and per foot of Round, Square, Hexagon and Octagonal Iron, Steel and Brass Stock.

Table or Chart to figure by arithmetic a pair of **Spiral**, Worm, Bevel, Spur Gears. Complete dimensions standard tapers, Morse, Brown & Sharpe, Jarno, etc. Tap Drill sizes, from actual practical use, also exact diameters bottom of thread for all standard American, English and Metric Threads in ordinary use. Dimensions of standard Stock Screws and Bolts of every description. Areas, Circumferences of Circles, Squares, Cubes, Square Roots, etc.

Complete tables of metric equivalents, in inches, feet, etc., with complete **metric system**, lengths, weights, etc.

Valuable Tables giving **number of teeth and flutes in Taps, End Mills, Counterbores** and **Reamers, Drills**, etc. Simple methods for figuring change gears for fractional and regular threads; compounding lathe for **cutting metric threads**, etc. Figuring Diameters, Speeds, Horse-Power, Belting, Shafting and Pulleys.

Complete Table to divide circle into equal parts, from 3 to 200 divisions. U. S. S., V. Whitworth, Standard Pipe Tap Threads, **Metric Standard** Threads, etc., and hundreds of other valuable and useful Tables, Rules, and Formulas.

**IMPORTANT NOTE—Worth a thousand times its price. Adopted as a standard reference by all the leading machinery and automobile manufacturers, and is of convenient pocket size.**

# Some Jig Making Practice Considerations and Comment- III.*

By M. R. Lawrence, M.I. Mech. E.

*We have come to look upon jigs and fixtures as such highly indispensable accessories to every class of mechanical engineering equipment manufacture that we may be apt in many cases to press them into service unwarrantably. The writer in this paper seeks to point out that their cost feature should be recorded carefully in every instance so as to ensure that they have been profitably applied, as well as being contributory to quality production.*

THE present is the third and concluded portion of the paper entitled "Some Jig Making Practice Considerations and Comment. Parts I. and II. will be found in our March 11 and 25 issues respectively.

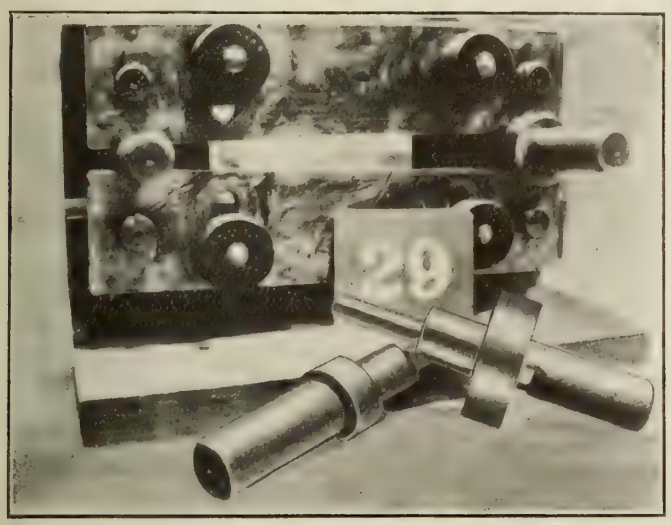

FIG. 17.

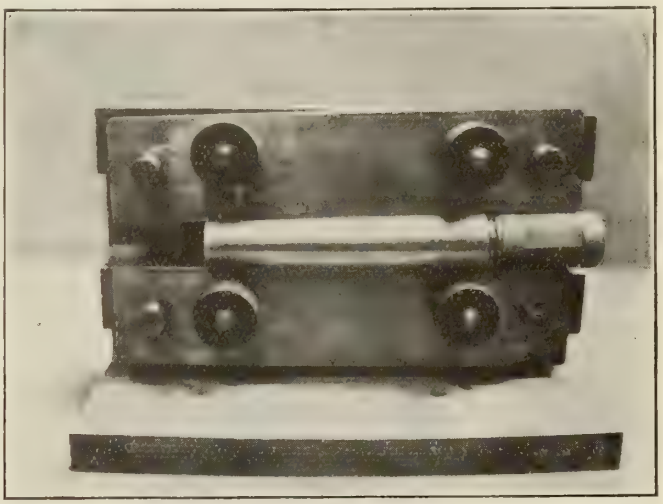

FIG. 18.

FIGS. 17 AND 18. "SINE" BARS MOUNTED ON ANGLE PLATE FOR TESTING TAPER GAUGES.

Another device which will be found extremely useful in every tool-room is what has been christened, for want of a better name, a "sine-bar." A sine-bar is a flat strip of steel, planed true all over, upon which are fixed two hardened and ground plugs, 1 in. in diameter, 10 in. apart. Two sine-bars mounted on an angle-plate are illustrated in Figs. 17 and 18. Mounted in this way, they are used for gauging taper-gauges, either circular or flat. Two holes are bored in the angle-plate exactly 10 in. apart, and the plugs illustrated made to fit them. To set to any desired angle it is only necessary to insert the correct gauges, and the two bars are brought up to touch them, and clamped in position by the knurled nuts illustrated. Standard sizes will be used for developing the Morse taper or any other tapers in current use, and any special taper can be readily developed when required. It is only necessary to look up the natural sign of the angle, multiply it by 10, as the centres are 10 in. apart, and the figure so arrived at is the difference in distance apart in inches between the two plugs fixed to the sine-bars. If a permanent record is required, a correct circular plug can be made to suit. It is wonderful how sensitive this gauge is to use; the slightest want of rectitude, especially in a round taper gauge, is perceived at once.

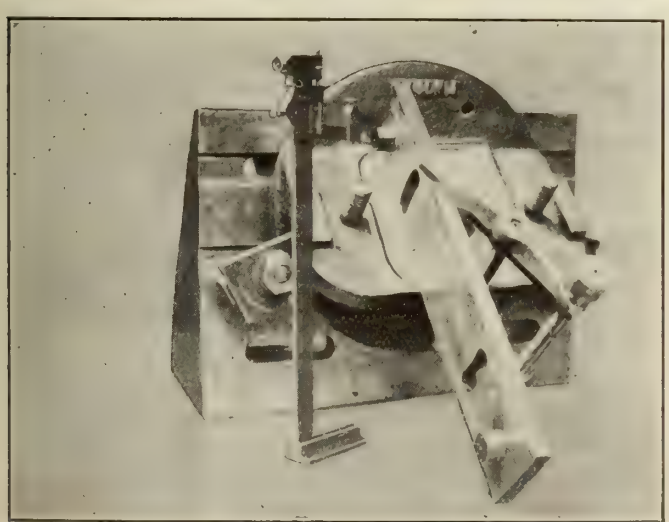

FIG. 19. "SINE" BAR SET UP FOR TESTING ANGLE PLATE.

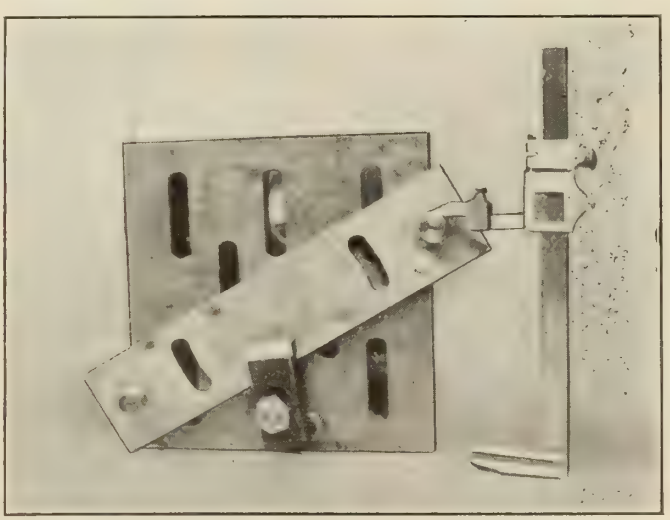

FIG. 20. SETTING "SINE" BAR TO DESIRED ANGLE.

Another good use to which the sine-bar can be put is illustrated in Figs. 19

*Paper read before the Manchester Association of Engineers, December 12, 1914.

and 20. In Fig. 19 it is shown testing the truth of an angle-plate. Upon the sine-bar are fixed two hardened and ground plugs, 1 in. in diameter and 10 in. apart. When mounted in this way, the difference in height between these two plugs and the surface-table is found from the sine-table. Take a concrete instance of a 30 deg. angle. The sine of

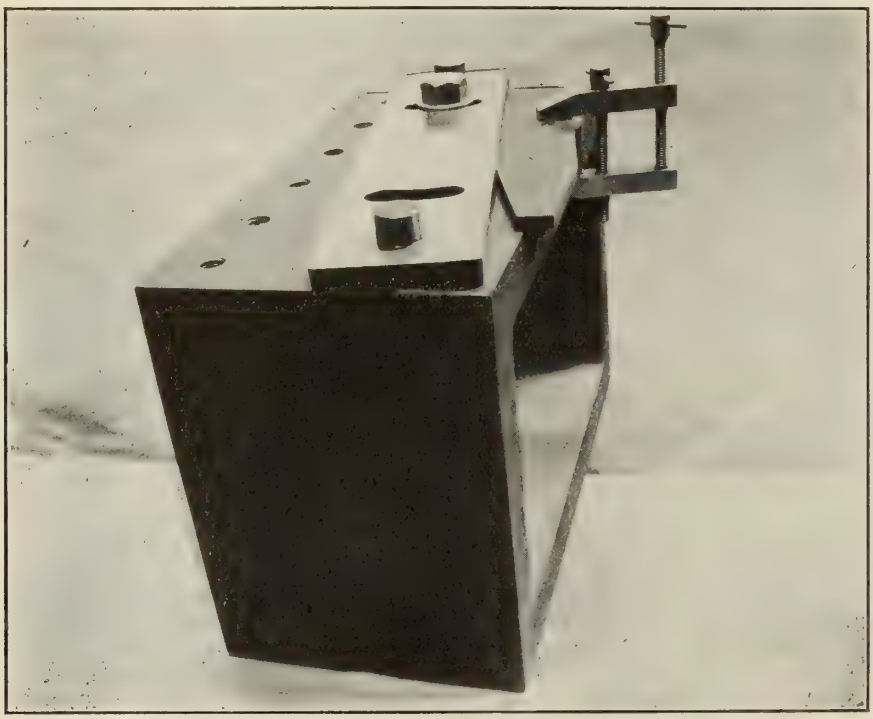

FIG. 21. SINE BAR SET UP FOR DEVELOPING GAUGE.

30 deg. is 0.500. Therefore, the difference in height between the plugs on the sine-bar is 5 in. The sine of 30 deg. 1 minute is 0.502, so that it will be easily seen that the device is very sensitive. Fig. 21 shows the sine-bar in use for developing an angle gauge. It is clamped

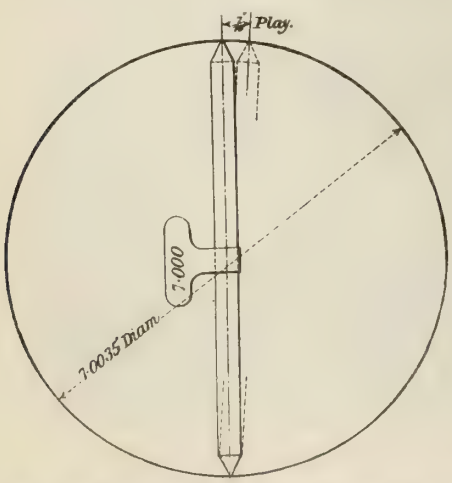

FIG. 22. GAUGING DIAMETER OF HOLE BY A WIRE GAUGE.

up to a hollow block machined true to itself on all faces and set to the half angle required in the gauge. A flat strip of steel with parallel sides is then clamped, as shown, with the end roughly trimmed to the angle. The whole is then mounted on a surface-grinder and the strip ground true to the angle on both sides.

Fig. 22 illustrates how a wire gauge may be used to measure the exact diameter of a hole which is slightly larger than the length of the gauge. One end of the gauge is held stationary, and the other is moved from side to side in the hole and the lateral movement observed. The oversize of the hole—i.e., the amount it is larger in diameter than the length of the gauge—is calculated by the use of the following formula:—

The oversize of the hole in thousandths of an inch equals the square of the sideways play of the gauge in sixteenths of an inch divided by the diameter of the hole in half inches.

Fig. 22 shows a wire gauge, 7 in. long, which has a play of 7-16 in. Therefore: The oversize of the hole in thousandths of an inch

$$= \frac{7^2}{7 \times 2} = \frac{49}{14} = 3.5,$$

therefore, diameter of the hole is 7.0035 inches.

This formula is accurate to the third decimal place when the amount of "play" does not exceed one-tenth of the diameter. It assumes that 32 squared = 1000.

In conclusion, the author wishes to express his thanks to Messrs. Wolseley Motors, Limited, for kindly allowing him to photograph these jigs and devices illustrated, and for lending him the exhibits on the table.

## RECONSTRUCTION OF C. P. R. LACHINE CANAL BRIDGE.

THE C. P. R. has kept its contractors working day and night during the past four months on a reconstruction of the bridge over the Lachine Canal, so as to double-track the last remaining stretch of single track between Montreal and Brigham Junction, beyond Farnham, Que. The contracts amounted to over two hundred thousand dollars, and were authorized by Sir Thomas Shaughnessy at a time when railway construction in Canada was supposed to be shut down.

What adds to the interest of this work is that it embodies features unique in bridge engineering. The waterway for traffic remains as wide as before, in spite of the additional track, the construction was carried on in winter, and the operation of trains continued as usual, while the plate girder swing span is reputed the longest space of its kind ever built, being 239 feet 7 inches long.

Especial credit is due to P. B. Motley, engineer of bridges for the C. P. R., who has been able to put through this remarkable work with record speed. The work on the substructure was not started till December 1, 1914, the bridge seats were ready to receive the steel girders on February 8, and the double-track service is now available.

### Work Features.

It was found possible to design a double track swing bridge in such a manner as to utilize, after enlargement, the old pivot pier of the original bridge, accommodating two tracks instead of one by the use of four deck plate girders instead of the original lattice truss construction, with the traffic running, as it were, through the bridge. It was thus possible to maintain traffic while the old structure was being demolished and the new one being built. Two girders were erected on the upstream side of the old bridge sufficient to carry traffic while the downstream side was altered, and the other two girders erected and connected up with lateral and other bracing.

The four girders, each of which weighs 112 tons, were shipped in three pieces from the Dominion Bridge Co. shops at Lachine, and were lowered into place by heavy derricks. When all the parts had been accurately assembled, they were riveted into their complete lengths, after which the operating machinery was installed. The weight of the whole swing span is 516 tons, while a 90-foot span, weighing about 143 tons at the south of the bridge replaces the old 40-foot deck plate girder span and accommodates the existing roadway, which is a continuation of St. Patrick Street, Montreal, and admits of the running of a future railway track along the south canal bank, if ever necessary.

**Bridge Operation.**

The new bridge will be operated by electricity, the power being carried by under-water cables under the canal to the centre pier, and there supplied through duplex 30 h.p. motors controlled from the operator's fireproof house on the north bank of the canal, where a special 30 h.p. motor is kept on hand for emergencies. These cables will be laid after the canal has been unwatered.

The work accomplished since December 1st includes the demolishing of the old single track abutments, the building of a new double track abutment, the widening of the earth embankment, the extension of two piers, one of which entailed considerable subaqueous work and bonding into the old stonework, and the extension of the old north abutment to accommodate the double track, and also to act as the lower storey for the operator's house. Since February 8 the erection of steel and building of masonry has gone on apace. The span will be operated by hand power meantime.

When finished, the bridge will be protected by the most modern interlocking machinery so as to make it impossible for a train to approach it before being properly closed and safely locked, and, in addition, it is impossible for the operator to open the bridge for canal traffic until all railway traffic is stopped at a safe distance from the bridge. All of these operations will be controlled from the operator's house, which will command a view up and down the canal even when trains are passing over the bridge. The new type of bridge will likewise give a much clearer view along the track than formerly, as there is no overhead lattice work projecting above the rail level. The structure will also be provided with a system of lights, as required by the Board of Railway Commissioners, for the protection of shipping on the canal.

The extensions to the sub-structure were carried out by the John S. Metcalf Co., Montreal, and the steel work was fabricated and erected by the Dominion Bridge Co., Lachine, P.Q.

## THE BIG GUN.

WHEN it is desired to convey an idea as to the offensive capabilities of any particular warship, it is quite usual to say that the vessel has so many guns of a particular calibre. If such a method of summarizing the armament of a warship is made use of for comparative purposes, says the Liverpool Journal of Commerce, it is quite liable to lead to considerable misconception as to the actual offensive merits of the vessels compared, unless the guns are of practically the same age. The fallacy of this method of comparison, if applied generally, lies in the fact that the many improvements introduced in the art of gunnery have enabled our experts to design and produce weapons of increased power and effectiveness from time to time without altering the calibre.

This point is perhaps best illustrated by the case of the 12-in. gun, which for a number of years held pride of place as the chief offensive weapon of practically all the navies of the world. The 12-in. gun is by no means a recent introduction, it being of historical interest to note that, at the bombardment of Alexandria, H.M.S. Monarch carried four weapons of this calibre. These guns were of the rifled muzzle-loading type, and weighed 25 tons apiece. The projectile weighed 608 lbs., and it was fired by a charge of pebble powder of 85 lbs. weight. This gun cannot, of course, be compared with the modern weapon, nor can it be claimed that it was representative of the type.

**First Modern Type 12-in. Gun.**

The first modern type 12-in. gun superseded the previous weapons about 1882, and its conception and rapid development were brought about by the introduction of new methods of construction and various important improvements in the nature and character of the powder. The various stages of progress were denoted by giving each class of gun a distinctive mark number, for example, 12-in. Mark V.

Marks III., IV., and V. were of only 30 calibres in length, and fired a 714 lbs. projectile with a muzzle-energy of 18,000 foot-tons, by means of the old prismatic brown powder. In the Mark VIII. weapon, the projectile is increased to its present weight of 850 lbs. This weapon is 35 calibres in length, and develops a muzzle-energy of 33,000 foot-tons. Mark IX. is a 50-ton gun of 40 calibres, having a muzzle-energy of 36,000 foot-tons; while the Mark X. 12-in. gun of 45 calibres weighs 58 tons and develops a muzzle-energy of 48,000 foot-tons. The last gun of this size, namely, the 50-calibre gun, developed 53,400 foot-tons muzzle-energy. The improvements attained in the later types can probably be best illustrated by comparing the penetrative power of each in inches of Krupp's steel with an uncapped shell at 3,000 yards. These figures are given in the following table:—

| | |
|---|---|
| 12-in Mark VIII. | —11½ in. |
| " IX. | —12½ in. |
| " | " —14 in. with improved cordite. |
| " X. | —17 in. |
| Latest weapons. | —22.2 in. |

From this it will be seen that the penetrative power of the 12-in. gun has been doubled in a period of years approximating to the life of a battleship.

**Comparison of 12-in. and 13.5-in. Guns.**

It is also of interest to compare the latest type of 12-in. gun with the earlier 13.5-in. weapon. These latter were of 45 calibre, and, consequently, the guns were of practically the same lengths. The 13.5-in. projectile weighs 1,250 lbs., and with a muzzle-energy of 63,000 foot-tons the penetration of Krupp's steel at 3,000 yards is 22.8 in. We thus see that from the point of view of penetration, there is little difference between the two weapons; but apart from other less obvious advantages, the larger gun fires a shell of nearly 50 per cent. greater weight, and consequently carries a much larger bursting charge.

## PULLEY SETTING FOR QUARTER-TURN BELT.

By "Woodworker."

SETTING pulleys for a quarter-turn belt has probably caused more argument than any other one subject connected with mechanics. Almost any one around a shop can tell how it is done, while few can do it. It was, therefore, not surprising, when I went to put in a drive of this kind, to have every one from the boss to the clean-up man, tell me how to do it. I did not, however, need the advice of any one, as a simple rule usually gets the belt right the first time, the exception being that where the driving and driven shafts are not an exact right angle, then the pulleys may have to be shifted a little to get an exact track on the belt.

Assuming that the upper and lower shafts are at right angles with each other, I set the driving or upper pulley so that a plumbline from centre of receiving side or face will come exactly in centre of face of driven pulley, less the diameter of driving pulley. The driven pulley is set so that a plumbline from the delivering face of driver will be in an exact line with a line through the centre of a cross-section of driven pulley. The lead of the belt is then on an exact centre from one pulley to the other, either up or down. This is assuming that the upper is the driving pulley. In case of a drive from below, the positions would have to be reversed.

The main idea is to get the centre of the delivery side of each pulley in a line crossways of the pulley receiving the belt. I do not know that it would make any difference if the centres were exactly plumb or not, but the latter idea is carried out, and excepting for the sag of the belt the drive would work as well horizontally as it does on a perpendicular. The action of the belt on a mule-stand is only an amplified example of a quarter-turn belt.—Dodge Idea.

# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## A MILLING MACHINE ATTACHMENT.

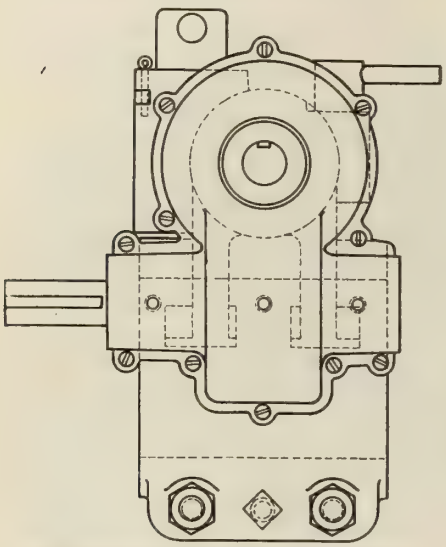
By D. O. Barrett.

FOR rounding out the ends of keyways in engine shafts to the full depth by means of an end mill, the attachment shown in the drawings was designed. Although designed for this one particular purpose, it could, no doubt, be used on a variety of other work if there were a large number of pieces to be duplicated. It consists of one main casting with a cover for the helical gears at the top. This casting is bored out to slide on the over-arm, and two ribs extend back and down, forming a bearing on two special steel washers on the arbor, one on either side of the cutter, each of these bearings being 2 inches long.

The spindle is carried in a sleeve, on the one side of which a rack is cut; the spindle is bored for a No. 3 Morse taper. The piece A is of round cold-drawn steel and carries the pinion teeth, 8-pitch, for operating the spindle sleeve. This is the same diameter for the full length, and is held in place by the key shown at the right. A slot is milled into the casting and a corresponding groove is turned in the pinion shaft, after which the odd-shaped key is put in place and held by a spring cotter. The main casting is split at the bottom and provided with a clamping device. A left-hand stud is used here, so that when the handle is out or down, in its most natural position, the spindle will be locked, as no counterweight was provided.

The main casting was bored out 2½ inches for the entire length, with the exception of the enlarged cored portion in the centre. The spindle was 1¼ inches in diameter. The spindle gears were of cast iron 3½ inches in diameter, the one around the spindle extending down into the main casting, with a 3-inch bearing. The cross shaft on which the other gear was held by means of a Woodruff key was 1¼ inches in diameter and ran in brass bushings held between the two halves of the case. The top of the gear case was also bored out to give a bearing for the spindle, thus giving a bearing on both sides of the gear. The insides of the case were machined and thrust collars of heavy sheet steel placed on each side of the gears. An extra pulley was used on the countershaft to drive the attachment, the vertical spindle thus operating in unison with the horizontal. All bearings with the exception of the one in the sleeve were equipped with grease cups.

When cutting keyways, the regular cutter was used to the full length required. The table was then run back a few inches and the vertical spindle carrying the end mill brought down until the cutter touched the bottom of the keyway. The table was next fed over by hand, after which the spindle was raised up entirely out of the way of the shaft and the sleeve locked.



MILLING MACHINE ATTACHMENT DETAIL.

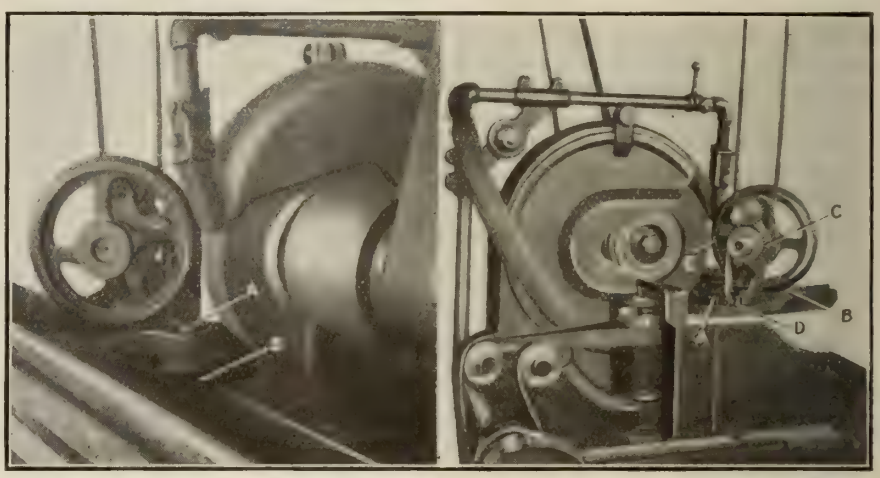


FIG. 13. GRINDING HANDWHEELS. FIG. 14. DETAILS OF THE MECHANISM.

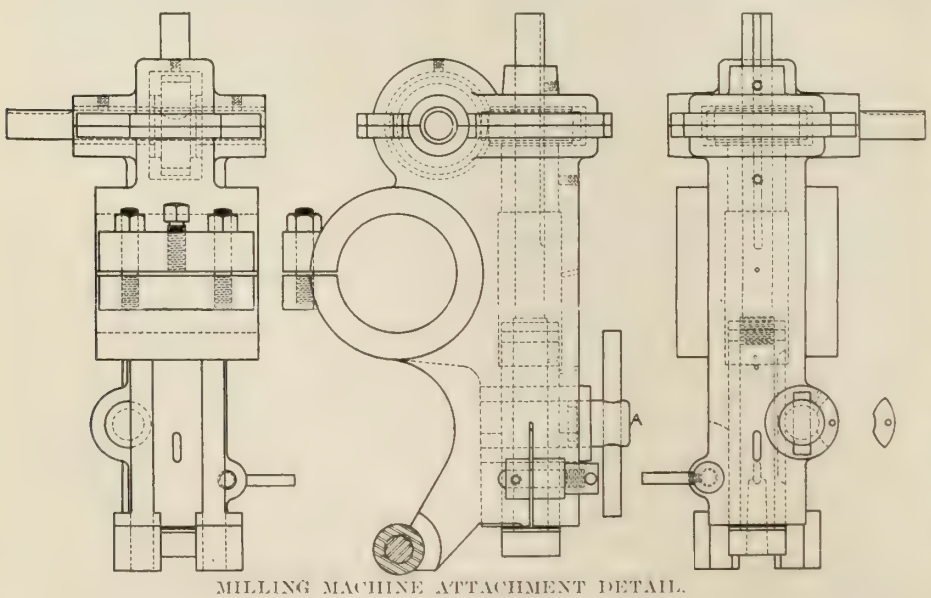

MILLING MACHINE ATTACHMENT DETAIL.

## DEVICES FOR FINISHING SPHERICAL SURFACES.—IV.

By Avery E. Granville.

MANY firms prefer to finish handwheel rims by grinding. The device shown in Fig. 13 is comparatively simple. A stud A is mounted in the table of the grinder.

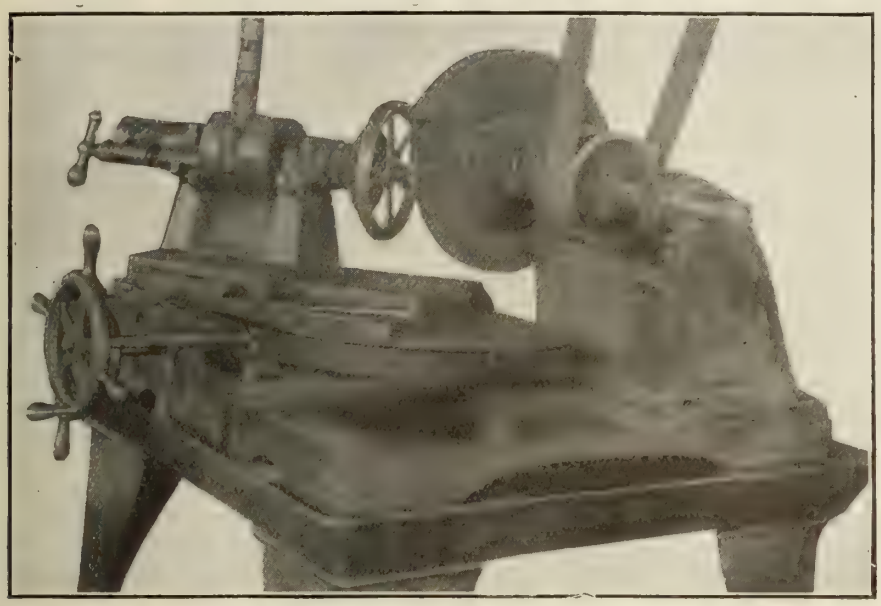

FIG. 15. A SPECIAL HAND WHEEL GRINDER.

Around this revolves the bracket B which carries the mechanism. This latter will be better understood by reference to Fig. 14, in which A is the gear segment on the base of the bracket B. Into this segment meshes the pinion D on the same shaft with the worm gear E. This worm gear is driven from a worm on the shaft with gear C, and the latter is driven from the gear above it by means of a pulley and the belt shown running up above it. The gear C is also on the same shaft on which the handwheel is mounted, so that the small belt drives both the wheel turning and rotary movements.

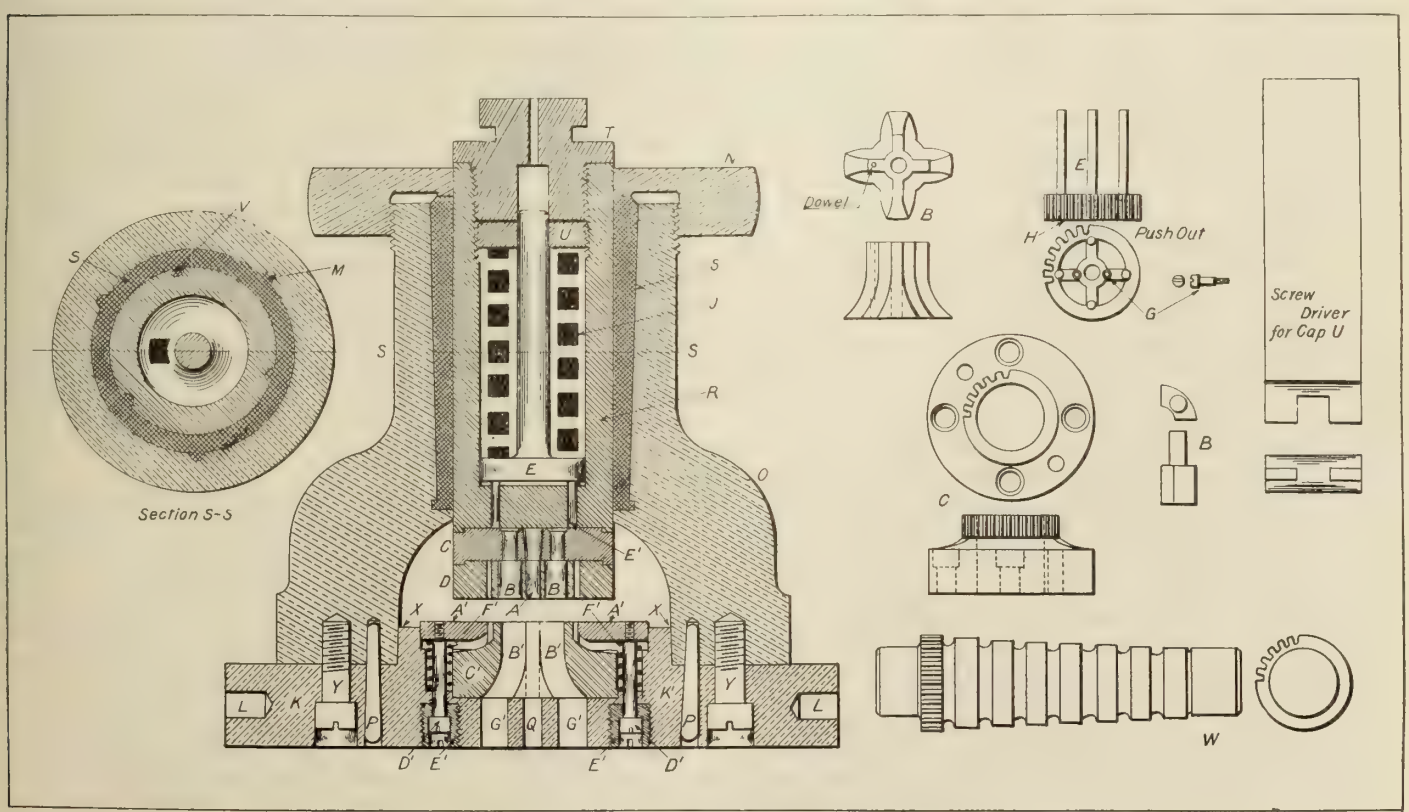
The device just described was made to be used on a regular grinder, but in Fig. 15 is shown a machine constructed by a big lathe building concern expressly for grinding handwheel rims and nothing else. The handwheel is mounted on the end of the grinding spindle and locked with a nut and split washer. It is turned during the grinding process by means of a universal jointed shaft from above. The grinding spindle bracket has a cross adjustment controlled by means of a small ball crank, while the rotary table is operated from the capstan wheel shown in front, through a worm and worm-wheel segment.

## UNIQUE SUB-PRESS DIE CONSTRUCTION.—II.

By A. L. Monrad.

PART I. of this article appeared in our February 25 issue, and dealt more particularly with the die detail. In the present instance the punch construction forms the leading feature.

The stripper-plate $A^1$ is made of low-grade tool steel, hardened and drawn to a dark straw color. The stripper-plate is turned to a snug fit in the recess of base K, and the hole bored exactly in its centre to fit the end of the broach. It is now broached in a similar manner to the die D, but to a sliding fit on the punch C. The web $B^1$ is made of the best grade die steel, and is fitted tightly into the punch C, being flared out at the bottom for strength. By flaring the web B, we get a wider base to support it, and the punchings have more room, as they slide down and the clearance in the base of die is a little more than a slot, being



UNIQUE SUB-PRESS DIE CONSTRUCTION FEATURES.

in fact an oval shape between the spiders.

The web B has a small dowel pin, about 1-16 inch, through one of the web arms to locate to punch C, as shown in the detail sketch. A cutter must be made to make this web B. With a careful indexing it can be machined very near to size, leaving enough for lapping after being hardened and drawn to a light straw color.

In its centre is bored a hole to a true plug fit for punch A. The punch $C^1$ is also made of the best die steel, hardened and drawn to a light straw color. It is bored out and lapped to a snug fit to receive the web B. The outside is turned to a push fit in the bottom recess of base K, and the gear teeth cut with the same cutter as the push-out H, to be a true fit in the die D. The punch is screwed and dowelled to the base K from the top, as shown in the detail sketch. The stripper plate $A^1$ is adjusted with four long shoulder screws $D^1$. A stiff spiral spring $F^1$ is placed in the counter-bored hole in the base K. A threaded steel bushing $E^1$ is fitted in the base K to easily adjust screws $D^1$, making top of stripper $A^1$ flush with top of punch $C^1$ and $B^1$. When $B^1$ is pressed up into $C^1$, it forms the centre part of the punch, and is also a die for the hole in the centre and the holes between arms.

The die and punch for gear teeth should be made first; then make the web and fit it before making punches for holes. In so doing, a more reliable fit can be obtained by making allowance for grinding and lapping. When assembling the die, place the die holder C in position on the plunger and transfer the screw holes through the holder. Now place the die in proper location on to the holder and transfer all the holes through the die into the holder. Drill the four push-out pin holes $E^1$ through the holder and plunger about 0.005-inch smaller than the original size. Then replace the die and the push-out gear H, and ream these holes through the holder and plunger. The push-out should now slide freely with the arm punchers $B^1$ and piercing punch A in the right place. We assume now that all the parts are assembled ready for babbitting. An extra cap is made like N, except that it has two elongated grooves milled in the bore for plungers, with ⅛-inch thick ring in between the frame and the cap to form a shoulder for babbitting on top.

A coating of black lead should be painted on the diametrical surface of plunger R. Lower the plunger through the cap and the bottom hole in the frame until the blanking punch enters the die. A gas flame should now be applied all round the frame to warm up the housing, so as to make babbitt flow freely all around. The babbitt should be heated in two ladles to a dark red color, and then poured in from both sides through the elongated grooves on top of the duplicate cap until the babbitt just enters the top of the washer in the cap. Now remove the plunger and cap from the frame, strap the housing on a faceplate and true up the babbitt hole, and cut a spiral oil groove the entire length of babbitt one between each rib. Force the plunger through the housing again and see where it bears the most, then scrape the babbitt until a good forced fit is secured. Remove the frame of the base while the die and punch are all together in their proper positions in the plunger and the base. Grind off the blanking die, piercing punches and stripper together. They should all be ground so all the parts are flush with each other and a true smooth surface. Everything should now be taken apart and the emery cleaned off by washing thoroughly in benzine or gasoline. All the parts should be oiled and placed in proper positions.

This is the best type of a sub-press die. The dies and punches are not backed off. The centre punch hole in the hub is taper reamed from the bottom, but has the top ¼ inch straight. When setting up, the punch should just barely enter die enough to cut a piece of tissue paper. This die should produce a very accurate blank and very little burr, providing it has been properly made. These advantages are two-point in a die of this type, and as it cannot be sheared, it will produce the quality and quantity for a number of years with very little repairing or grinding.

## SIGNIFICANT DEVELOPMENTS ARISING OUT OF THE WAR.

STRIKING evidence of the significance of war orders to the steel trade in Canada comes from the stock market—and there is no better barometer by which the actual effect of business and industrial changes can be judged. Last week at Montreal Nova Scotia Steel and Coal stock, which had been neglected at the minimum of $45¾ and had been selling at materially under that figure unofficially, moved above the minimum, and, on rapid trading, advanced as high as $55, a gain of nearly ten points from the official low. This was a remarkable performance under the general industrial and financial conditions prevailing, and in view of the earnings of the company last year. At the same time stimulation was given to other steel stocks and Dominion Steel common also passed above its minimum of 20.

The answer to the question as to the rapid rise of Nova Scotia stock must be that the buying public has reason to believe that war orders have greatly improved the earnings of the company. That the improvement must be material may be judged from the fact that the annual statement published only a few weeks ago showed that during 1914 the earnings of the company had fallen off 76 per cent. and that there was a deficit created of $620,000 for the year. This report came out long after the minimum figure had been fixed. However, late gossip from Nova Scotia goes so far as to predict that not only will the war business bring the company back to a normal position but that the earnings for 1915 promise to be the best in history. The earnings in 1913 were $1,225,000, and in 1914 $415,000.

It is believed that there are to-day between 8,000 and 9,000 shells being manufactured at the plant every twenty-four hours and that there is a profit on this business of $5,000. In addition, the company's 60,000 tonnage has been chartered on a very favorable basis. Working along these lines a figure of $2,000,000 as profits for 1915 is regarded as certain.

Nova Scotia Steel is only one example of the war business. Practically every plant in Canada in a position to take care of any of these orders or to manufacture shell parts can get its share. In addition to the orders placed from Great Britain through the Shell Committee, there is the big order of the Russian Government, which has been estimated as high as $80,000,000, and which the Canadian Car & Foundry Company is distributing over Canada and the United States.

The bulk of this latter business will go to the States on account of price competition, and on account of the fact that Canadian concerns are not in a position to handle it. However, an official of the Car Company states that the Canadian field is steadily developing and that they have been surprised by the large number of concerns which have recently put themselves in a position to get a share of the business. A recent report that shells were being manufactured at a number of cities from Winnipeg through to the coast is only one indication of the broad benefits which Canadian industry is getting in the manufacture of ammunition for the guns of the Allies.

**Shaft Connections to Motor.**—Motors used in group driving may be connected to the shafting in various ways. If conditions will permit, a good way is to use a motor with extended shaft and locate it in the centre of driven line, coupling each piece of shafting direct to motor by flexible couplings. If the line is short or power light, the motor may be located at one end and coupled direct. The latter method, of course, does away with the necessity of a special motor with extended shaft.

## DESIGNING AN ENGINE CRANK SHAFT.

By J. P. S.

THE main difference between a college man and a self-made man in the mechanical line is that the former has been trained how to seek out specific information concerning the various properties of materials. The college training is also calculated to enable a man to make certain reasonable assumptions of strengths of materials, possible methods of loading, etc., where absolute data is not available. The concession by the greater number of mechanics, that questions of design are entirely out of their reach is unwarranted. The practical mechanic who has mastered the more important principles of design is many times better off than the youth whose father has put him through college but who has failed to give him that training which can only be secured in overalls.

The following simple exercise is intended to illustrate a common method of procedure for the proportioning of an ordinary engine shaft with single overhung crank. The engine is to be of approximately 400 H.P., and the crank shaft will be confined to a length of 12 feet with two bearings.

The size of the engine will be determined by assuming convenient sizes for certain parts and, by trial calculations, obtain the most suitable combination of sizes that will give the desired horsepower. Let the cylinder diameter be 24 inches, the stroke 48 inches and the steam pressure 100 pounds per square inch. Assuming a back pressure of about 5 pounds absolute, a cut-off at 20 per cent. and 3 per cent. clearance, the mean effective pressure will be about 53 pounds per square inch. This may be determined either from tables or formula. Formula for horsepower is,

$$\text{H.P.} = \frac{\text{plan}}{33000} \quad \text{or} \quad n = \frac{\text{H.P.} \times 33{,}000}{\text{pla}}$$ where

n = number of strokes per minute, p = mean effective pressure, a = area of piston in square inches, H.P. = horsepower, and l = length of stroke in feet. Supplying values,

$$n = \frac{400 \times 33000}{53 \times 4 \times 452.39} = 137.63,$$ or an engine of the above dimensions would develop 400 H.P. at $\frac{137.63}{2} = 68.8$ r.p.m., which is a satisfactory speed for a slow speed Corliss.

**Piston Thrust.** — The maximum pressure upon the piston rod is, area of piston × max. steam pressure = 452.39 × 110 = 49,762.9 pounds. For calculation purposes we will call this 50,000 pounds. Determine approximate size of crank shaft. Greatest twisting moment is 24 × 49,762.9 = 1,194,309.6 inch pounds.

The Polar Moment of Inertia (from handbooks) for a round shaft is $\frac{3.1416d^4}{32}$

and the general beam formula is $\frac{M}{S} = \frac{I}{c}$, where M = maximum moment; S = working stress; I = Polar moment of inertia and c = greatest radius.

$$\frac{I}{c} = \frac{3.1416d^4}{32} \times \frac{2}{d} = \frac{3.1416d^3}{16}$$

Now, $\frac{3.1416d^3}{16} = \frac{M}{S} = \frac{1{,}194{,}309.6}{10{,}000}$

$$d^3 = \frac{1{,}194{,}309.6}{10{,}000} \times \frac{16}{3.1416} = 608.25.$$

d = cube root of 608.25.

= 8.48 inches, which is the trial diameter of the shaft.

**Crank End Bearing.** — From this we can determine the length of the crank bearing. The pressure alternates in direction which allows oil to work in and permits higher bearing pressures, say 450 pounds per square inch (a high value). Total area required is therefore $\frac{49{,}762.9}{450} = 110.58$ sq. inches. Length of bearing $= \frac{110.58}{8} = 13.82$ or say 14 inches.

The crank arm is usually shrunk or pressed on the shaft and has a bearing thereon equal in length to the diameter of the shaft for a steel crank arm. The length of this bearing will be, therefore, about 8 inches and the forcing pressure should be about 60-75 tons. The key may be made equal in width to ¼ the shaft diameter, and, in thickness, from ½ to ¾ of its width. The key dimensions therefore are 2 inches wide, 1¼ inches thick and 8 inches long.

**Crank Pin.**—The length of the crank pin is usually made from 1.25 to 1.5 times its diameter. The bearing pressure may be from 1500 to 2500 pounds per square inch, say 2000 pounds. The projected area required is therefore, $\frac{49762.9}{2000}$ = 24.88 square inches.

The required shearing area of the pin is $\frac{49{,}762.9}{14000} = 3.55$. This is small and need not be considered.

The required cross section to resist bending is obtained from the beam formula $\frac{M}{S} = \frac{I}{c}$ in which M = bending moment $= 50{,}000 \times \frac{\text{length}}{2} = 50{,}000 \times \frac{d \times 1.25}{2}$ (d=diameter).

S = working tensile strength of open hearth steel = 18,000 pounds per square inch.

I = Moment of inertia $= \frac{3.1416d^4}{64}$ (from handbook.)

c = radius $= \frac{d}{2}$.

$$\frac{I}{c} = \frac{3.1416d^4}{64} \times \frac{2}{d} = \frac{3.1416d^3}{32}.$$

Now, $\frac{50{,}000 \times .625d}{18{,}000} = \frac{3.1416d^3}{32}$

or $d^2 = \frac{50{,}000}{18{,}000} \times \frac{32 \times .625}{3.1416} = 17.66$

or $d = \sqrt{17.66} = 4.2$

This is evidently the value to use. Making the diameter 4½ inches, the length becomes 4.5 × 1.25 = 5.62, say 5⅝ inches. This gives a projected area of 5⅝ × 4½ = 25.31 square inches. The required bearing surface has been found to be 24.88 square inches, so that the dimensions obtained by designing the pin for bending satisfies all other considerations.

**Main Bearing.**—The foregoing calculations may be regarded as preliminary work and furnish us with dimensions which may be used to determine the size of the crank shaft proper.

The length of the main bearing has been found to be 14 inches. The distance between the centre of the main bearing and the centre of the crank pin is

$\frac{14}{2}+8+\frac{6}{2}$ inches, to nearest whole number, = 18 inches. Distance between centre line of crank bearing and centre of outboard bearing is 9 feet.

Considering the outboard bearing as a fulcrum, we find the actual thrust against the crank bearing to be

$$\frac{9+1.5\times50{,}000}{9}=\frac{10.5\times50{,}000}{9}=58{,}333$$

pounds.

The crank shaft is subjected to a bending moment, due to the piston thrust, of $18\times50{,}000$ inch pounds and a twisting moment of $50{,}000\times24$ inch pounds. This combination is best solved by combining both in either twisting moment or bending moment. Thus, equivalent bending moment

$$=Mb+\frac{\sqrt{(Mb^2+Mt^2)}}{2}$$

where Mb=bending moment and Mt =twisting moment.

Equivalent Bending Moment$=900{,}000+\frac{\sqrt{(900{,}000^2+1{,}200{,}000^2)}}{2}$

$= 900{,}000 + 750{,}000 = 1{,}650{,}000$ inch pounds.

Tensile working strength of mild steel shaft under alternating load = 15,000 pounds.

Applying the beam formula $\frac{M}{S}=\frac{I}{c}$ in which M = bending moment, S = working stress, I = moment of inertia which, for a round section $=\frac{3.1416d^4}{64}$ and c = greatest radius $=\frac{d}{2}$ where d = diameter.

$$\frac{I}{c}=\frac{3.1416d^4}{64}\times\frac{2}{d}=\frac{3.1416d^3}{32}$$

$$\frac{3.1416d^3}{32}=\frac{1{,}650{,}000}{15{,}000}\quad\text{or}\quad d^3=\frac{1{,}600{,}000}{15{,}000}\times\frac{32}{3.1416}$$

or $d^3 = 1086.5$ or diameter = cube root of 1086.5 = 10.28.

That is, the diameter of the shaft at the crank bearing must be 10¼ inches. With the 14-inch bearing this gives a projected area of 143.5 square inches and a working pressure $\frac{50{,}000}{143.5}=348.5$ pounds per square inch, which, if anything, is a little high, the bearing could be increased to 15 or 16 inches with good results.

**Outboard Bearing.** — The outboard bearing sustains half the weight of the flywheel and the pull of the belt. This thrust amounts to approximately ten tons or 20,000 pounds. The thrust on the outboard bearing due to the steam pressure is, using the crank bearing as a fulcrum, $\frac{50{,}000\times1.5}{9}=8{,}333$ pounds.

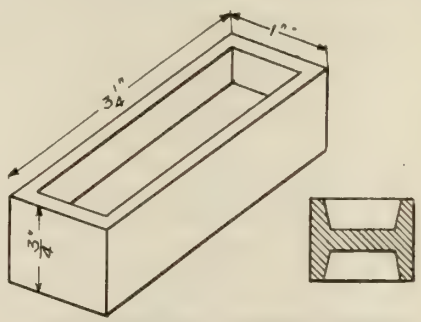
It is evident that this bearing will be designed for the former consideration. Assuming a bearing pressure of 300 pounds per square inch, the projected area required is $\frac{20{,}000}{300}=66.6$ sq. in.

Making the shaft 8 inches in diameter at this point, the length of bearing required becomes $\frac{66.6}{8}=8.3$ inches. This bearing would best be made 10 inches long.

## PROJECTED FOUNDRY DATA REQUIRED.

By D. A. Hampson.

A MANUFACTURER uses about 3,000 castings a day, of a general shape as shown in the accompanying sketch, and each lot averages about 500 lb. weight. They are made from brass patterns, eight on a gate, and there are thirty different sizes with a corresponding number of pattern sets. In addition to this, there is a daily consumption of about 800 lb. of similar shape castings, mostly in larger sizes, and a limited amount of smaller cored work.



LARGE QUANTITY CASTINGS SAMPLE.

The nearest foundry doing this class of work is sixty miles away, which makes it inconvenient to secure prompt delivery or hurry orders and to change patterns quickly when large quantities of a few sizes are wanted ahead of others. Another trouble experienced is the variety in sizes of castings from the same metal pattern, due probably to the work of different men, all molding being hand rammed.

In order to overcome much of this difficulty and inconvenience, it has been under consideration to erect a small foundry in conjunction with the present machine plant for doing this work, and answers to the following questions in this connection are desired:

How many men would be required for such a foundry?

About what equipment would be most suitable?

About what type, and how many moulding machines would be required, and would machine moulding give more uniform castings?

Would it be necessary to change the size of the patterns when mounting these on machines.

## BRITISH RESIDENT PURCHASING AGENT LEAVES.

THE resident purchasing agent of the British War Office, Col. Barton, on April 1, performed his last official duty here in connection with buying of war materials, when he placed an order for 500,000 pounds of candles with firms in this country. The order will be divided up in large monthly shipments, and means a distribution of some $450,000 among Canadian manufacturers.

Col. Barton left for New York on April 2, and sailed for England via the Lusitania. Lieut. Johnston will look after the office here until the large clothing order, valued approximately at $4,500,000, is all shipped. This is expected to take place within a month and after that date the Dominion Government will handle all purchases of war materials made in Canada.

The hard work in connection with War Office buying in this country has now been completed. Manufacturers know what is required, how and where to ship the goods, and if future Canadian materials are needed, repeat orders can be readily placed.

## SHELL MANUFACTURING AREA EXTENDING.

THE manufacture of shells for the British army, which has been carried on almost entirely in Eastern Canada, is to be extended in the West as the result of a conference held at Ottawa, on March 31, between Hon. Sam Hughes, members of the Shell Committee, of which Col. Bertram is chairman, and representatives of various Western cities. Following the conference, David Carnegie, ordnance expert, accompanied by experts from the Department of Mines and McGill University, left for the West, where they will visit a number of cities and ascertain to what extent factories and foundries there can be utilized. Shells have been manufactured in Winnipeg for some time and it is thought that similar work can be done in the other cities, represented at the conference. These consisted of Brandon, Regina, Moosejaw, Portage La Prairie, Medicine Hat, Calgary, Lethbridge, Edmonton, Vancouver and Victoria.

# FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

## INCREASING THE OUTPUT OF YOUR FOUNDRY.*

By G. K. Hooper.**

LIKE every other manufacturing establishment, a foundry is a device for making money out of labor; therefore, in designing such a plant, every means should be embodied to enable the laborers, whether skilled or unskilled, to do the utmost useful work which they are reasonably able to perform, having in mind their bodily, mental and social necessities.

In the early beginnings of the foundry business, so little information was available concerning its fundamental sciences of metallurgy, practical geology and the hydrodynamics of molten metal that skill in an operative was largely a matter of intuition or genius. The trade, therefore, being built upon this, has not adapted itself as freely as possible to the sub-division of labor and use of mechanical appliances as have other trades, and the productiveness of the labor in it has not advanced rapidly. The processes, also, under this condition have a tendency to be wasteful in time and space.

In the foundry where no sub-division of labor is used, this productiveness averages, according to studies which I have made, from 50 to 60 per cent. With the sub-division of labor and the use of mechanical appliances and power, it rises to about 75 per cent. With well arranged machine tools in the machinist trade, we are advised that the productivity of the labor has risen as high as 80 per cent., and on some classes of work to a higher figure.

### What Adam Smith Said.

As there are yet a number of foundry executives who believe that it is unwise, if not impossible, to use machinery and divide their labor, or in other words, to use what is known as the gang system, I would like to quote what Adam Smith, the first great expounder of economics, says about sub-division of labor in his work known as "The Wealth of Nations," written about 1755. He speaks as follows:—

The greatest improvement, in the productive powers of labor and the greater part of the skill, dexterity and judgment with which it is anywhere directed or applied seems to have been the effects of the division of labor. The great increase in the quantity of work which in consequence of the division of labor the same number of people are capable of performing, is owing to three different circumstances:—

First—The increase of dexterity in every particular workman.

Second—To the saving of time which is commonly lost in passing from one species of work to another.

Third — To the invention of a great number of machines which facilitate and abridge labor and enable one man to do the work of many.

It is the great multiplication of the production of all of the different arts in consequence of the division of labor which occasion in a well-governed society that universal opulence which extends itself to the lowest ranks of people. Every workman has a great quantity of his own work to dispose of beyond what he himself has occasion for, and every other workman being exactly in the same situation, he is enabled to exchange a great quantity, or, what comes to the quantity of his own goods for a great same thing, for the price of a great quantity of theirs. He supplies them abundantly with what they have occasion for and they accommodate him as amply with what he has occasion for, and a general plenty diffuses itself through all the different ranks of society.

This sounds something like a treatise on the evils of restricting output. Mr. Smith gives also some statistics concerning results of sub-division in the pin and nail-making industries, generally as follows:—With pins, one man by hand could make but about 20 per day, or 10 men could make 200 per day; whereas, by sub-division of the 18 different operations and with indifferent machinery, 10 men do make about 48,000 per day. With nails, he reports:—

A blacksmith who has been accustomed to make nails can seldom, with his utmost diligence, make over 800 to 1,000 nails per day. I have seen several boys under 20 years of age who had never exercised any other trade but that of making nails, and who when they exerted themselves could make, each of them, upwards of 2,300 nails per day, the same person blowing the bellows, stirring and minding the fire, heating the iron and forging every part of the nail, being also obliged to change his tools in forging the head.

We might conjecture from the foregoing that there were scientific management and efficiency experts, even as early as 1750, and that achievement in the efficiency profession has fallen off since that time as no such percentages of improvement as the above figures entail, are offered us to-day. With the better technical understanding which now exists concerning the underlying sciences of the foundry trade, there is more and more application of engineering talent to the investigation of the problems which arise. It is also as much a matter of engineering to find out what the human machine can be reasonably expected to perform as it is to properly judge the fitness of any mechanical device for foundry operation.

In foundry design, quite as much as in any other occupation, the quantity, quality and form of the product establish the limits within which a design must be contained in order to reach that most desirable situation, the providing for improvement of plant and equipment and the obtaining of substantial net profits.

### Application of Labor to Product.

The application of labor to the product is the next consideration. If skilled labor is necessary, means must be used to apply the skill only to those operations in which it is needed, sub-division of labor and the use of mechanical appliances and power being embodied wherever this can be profitably done.

In the molding and casting operations, a considerable number of foundries to-day do sub-divide the labor on their product and employ separate labor gangs for pouring, shifting and shaking-out, sand-handling and core-setting. Some objection is made to this practice, but, as you have heard, it is sound economics to sub-divide the labor, when the amount of product warrants it and an increase of skill may reasonably be expected to result, giving an increased production with corresponding reduction of cost. Some confusion may arise at the commencement of such a method of operation, but this can be minimized by using the most skillful and intelligent operatives as gang bosses.

*Presented at a meeting of the Newark, N.J., Foundrymen's Association.

**Of the Hooper-Falkenau Engineering Co., New York.

To do away with the laborious part of lifting and transporting materials, there is the industrial railway with or without locomotive, the overhead monorail trolley track, either with or without power-driven traveling hoist, the air hoist, the jib crane, traveling wall crane and overhead crane which covers nearly the entire floor area. Combinations of these are frequently used.

### Molding Machines.

For molding, molding machines of one kind or another, from the simple hand squeezer and the pneumatic hand rammer to the more elaborate power-ramming, pattern-drawing, rock-over type are available, each well adapted to some particular purpose. The molding machine is employed to advantage on a great variety of product and more and more uses are found for it every day. You are, however, familar with mistakes which have been made in the wrongful selection of molding machinery for any given work resulting in confusion as to the merits of such devices, and in loss. The general proposition still exists, however, that molding machinery properly adaptable to the work will increase profitably the productiveness of the laborer.

### Metal Pouring.

Arrangements are made for improving the productivity of the pouring operations by bringing large quantities of hot metal to the work in bull ladles; by taking the molds to the melted metal, at or near the cupola; by trucks running on the floor; by cars on industrial tracks pushed by steam or electric locomotives, and by conveyors on which the molds are weighted or clamped, sometimes jacketed; poured while in motion; cooled and removed at the proper time and with flasks, bottom boards, weights, etc., returned to the molding stations while the sand and castings go elsewhere for suitable attention. There also are special forms of ladles, such as the multi-lip, which add to the productiveness of the labor.

### Metal Melting.

In melting equipment, there is available for the cupola the tilting or rocking spout and the charging machine; for the reverberatory furnace in malleable work, the overhead traveler for lifting bungs and handling the fresh charge in dumping trays or skips; for the open hearth steel furnace, the charging machine and gas producer. To these two latter types of furnace, a number of attempts are being made to attach the mechanical stoker and to utilize also the direct burning of coal in powdered form. For non-ferrous metals, there is the tilting furnace.

### Sand and Castings Handling.

In sand-handling, a number of devices are successfully used from the simple sand-cutting machine operating on the sand heap on the foundry floor to the complete apparatus which takes shaken-out sand, cools, cleans and tempers it, mixes it with the proper proportion of new sand and delivers it again to the mold maker.

In shaking out and handling castings, sprues, etc., mechanical appliances also have been developed from the simple grating on which molds are dumped to the complete conveyer which carries the shaken-out sand and castings to shaking gratings on which they are separated and from which they are discharged into some suitable arrangement for cooling, the sprues and runners having been disposed of at the proper time. The cranes, travelers and industrial tracks, previously mentioned, also are available for this work, it being a matter for study in each case whether it is more economical to move the iron to the molds by hand or mechanical means, or vice versa.

When quantities are large and the product such that a few sizes of molds may be standardized, even though of considerable difference in size, there will be combined all of these devices, such as the molding machine, sand-handling system, mold conveyor and shaking-out conveyor, all of the operations being conducted uninterruptedly throughout the entire working day. Attempts have been made to operate such plants by means of two or three shifts throughout the whole 24 hours. The success of this development so far is doubtful. You will recognize that such 24-hour operation could not, in any way, increase the relative productivity of the labor.

### Cleaning Castings.

In cleaning, progress has been made from the hammer and chisel, steel brush and emery wheel to the power chipper, metal saw, sprue cutter, exhaust tumbler and sand blast machine. Long tumbling mills have been attempted a number of times in which the castings to be cleaned were fed in at one end and discharged fully cleaned at the other. These present attractive possibilities when material is fairly uniform in size and shape, and is not hollow, deeply cored, recessed or of considerable variation in size.

For these latter conditions, it has been found that while certain sizes in the charge may be satisfactorily cleaned in this way, the whole contents will not be as satisfactorily cleaned, so that on the whole, these devices have been a success only where the work is uniform in size and simple in nature. The exhaust tumbling mill and the sand blast machines, such as the revolving and traveling table machines and the sand blast barrel each are in satisfactory operation to increase the productiveness of labor in cleaning operations. Mechanical appliances embodying grinding wheels are available, increasing the effectiveness in removing roughness. They also are used to roughly-dimension such pieces as can be finished in this way.

### Acid Cleaning.

When large quantities of castings are made, which on account of being machined require careful cleaning to save time and tools, pickling plants, embodying mechanical handling, are designed in which the castings are handled on pans, acid poured upon them by ladles or from a hose connected with a reservoir to which the acid is again pumped after draining. The castings then are delivered to a washing floor where they are washed while still on the tray by streams of water under considerable pressure, after which they are dried and sorted. This means has given economical results for castings which are required to be very clean.

In the core department, various problems present themselves calling for the application of sub-division of labor and of mechanical devices. There are sand driers, mixers for properly amalgamating the necessary materials, ramming machines of various types, cutting - off and pointing machinery, handling devices for saving steps for the coremakers and ovens, more or less elaborate, for making the best use of time, labor and fuel.

A raw material yard also is a problem for engineering thought. There we have lifting and carrying machinery in the shape of locomotive and overhead cranes and industrial cars, together with scrap and pig breakers. There is also the sprue breaker which simplifies considerably the handling of this awkward and bulky material. Elevators to the charging floor usually come under the head of yard machinery, and here we have also the slag barrel and water barrel for preventing waste of material.

Attention is now being given to the saving of sand by rebonding processes in order to economize in raw material and in the disposal of waste, as in sand the binding material is but a small proportion of the entire mass and injury to this binding element which prevents its further usefulness results in the loss of disproportionately large quantities of the refractory portion of the mass.

### The Foundry Building.

The building which is to house the proper arrangement of apparatus is also a subject for engineering thought. The first consideration, of course, is that the full possibilities of the arrangement

of the apparatus and operations shall be developed. Care should be executed to prevent the manufacture of anything that might be an obstacle to the development of any particular function, that is, the building should be of such type of construction that changes in its form, openings, etc., may readily be made. The march of improvement is so rapid in this country that it is impossible to predict how often the manner of turning out products will be changed. The building, therefore, must be adaptable.

### Two Storey Foundry.

I personally prefer brick and steel construction to any other and have had no reason to alter this opinion after considerable experience in building this type of manufacturing plant. Where much machinery is used, especially conveying machinery, it often develops that instead of using sub-grade construction, an advantage, both in first cost and operation, is gained by making the building of more than one storey. This has led to the so-called two-storey foundry, which is in successful use where the quantity of production is great and the use of machinery extensive. Co-existent with the foregoing considerations are those of proper lighting, ventilation, heating, etc., that the human machine may operate in freedom from mental or bodily discomfort, thus securing the utmost which it is reasonable to expect from human endurance. The construction itself calls for careful study that wear and tear from usage and the elements shall be properly attained without too great a first cost.

Among the elements to which the structure is most subject to attack is fire; principally from the inside on account of the nature of the occupation and somewhat from the outside, by reason of the proximity of other structures. There are available the sprinkler, the metal window sash, wire glass and the tile roof to minimize this source of loss. They are big dividend payers to the foundryman.

### Permanent Molds.

A considerable economy is to be attained in operation in the present state of the foundry business by the use of the well-recognized principles of subdivision and application of machinery and power. From a 50 per cent. productivity in the case of labor not subdivided and little or no machinery, to 75 per cent. to be attained where these principles are most fully applied, represents a saving of 50 per cent.

A productivity of 75 per cent. is, in my belief, about the limit that can be reached in the foundry art with such operations as are necessary at this time. There may be, of course, individual instances which will exceed this, but the figure refers to the average. It may be that we shall find in the permanent mold a method which will considerably increase the relative productivity of the labor. Time studies on repetition work to which the permanent mold would be applicable, show that there is many times as much labor consumed in making the present mold by present methods as is used in pouring and shaking-out, while the material handled in the making of molds is frequently ten-fold or more the weight of the castings produced. Also, there are several pieces of equipment to be handled to one casting or gate of castings. If the permanent mold could be developed these ratios would be cut down and less material as well as fewer parts would be handled. Of the 50 per cent. increase in productivity of the man, at present available, however, you can all secure a part. Some sub-division of labor and some mechanical apparatus is applicable to part or a whole of the operations in the jobbing shop and in the shop which handles a considerable range of standard work.

A mechanical engineer and manufacturer of world-wide reputation has said that "the achievement of a result regardless of cost, is not engineering." Having this in mind, it is essential to carefully study all conditions. In arriving at a practical conclusion as to the installation of machinery and the subdivision of labor, the cost of installation and operation and the possible increase of product must be considered as well as the increase of productiveness of labor.

We have been called upon to examine cases where unintelligent application of mechanical devices materially diminished the productiveness of the labor in addition to entailing heavy expense in installation and operation. On the other hand, the highest productivity and hence, greatest economy in production have been obtained where the apparatus and sub-division of labor have been most intelligently employed.

### COMING CONVENTIONS.

**Master Boiler Makers' Association, Chicago, Ill.—May 26-28.**

**American Railway Master Mechanics' Association, Atlantic City, N.J.—June 9-11.**

**Master Car Builders' Association, Atlantic City, N.J.—June 14-16.**

**American Foundrymen's Association, Atlantic City, N.J.—Sept. 27-Oct. 1.**

**Foundry and Machine Exhibition Co., Atlantic City, N.J.—Sept. 25-Oct. 2.**

## AMERICAN FOUNDRYMEN'S ASSOCIATION CONVENTION.

THE annual meeting of the American Foundrymen's Association will be held at Atlantic City during the week of Sept. 27, with headquarters at the Marlborough-Blenheim hotel, business and technical sessions being conducted on Young's steel pier, almost directly opposite the Marlborough-Blenheim. The exhibit of foundry equipment and supplies under the auspices of the Foundry and Machine Exhibition Co., will be held on the steel pier, and will open on Saturday, Sept. 25. A tentative program of the convention has been adopted as follows:

**Monday, Sept. 27.**

Registration at headquarters, Young's steel pier.

**Tuesday, Sept. 28.**

10 a.m. — Opening session, joint meeting between the American Foundrymen's Association and the American Institute of Metals.

2 p.m.—Operating session.

**Wednesday, Sept. 29.**

10 a.m.—Joint General session between the American Foundrymen's Association and the American Institute of Metals.

2 p.m.—Gray iron session.

8 p.m.—Business session, annual address by president, election of officers.

**Thursday, Sept. 30.**

10 a.m.—Simultaneous sessions on steel and malleable iron.

2 p.m.—Simultaneous sessions on steel and malleable iron.

7 p.m.—Annual banquet.

**Friday, Oct. 1.**

10 a.m.—Final business session.

It will be noted that this tentative program provides for two sessions for the discussion of cast steel and two meetings will be devoted to malleable iron. At the last meeting in Chicago, insufficient time was allotted for the discussion of the many valuable papers presented, and to enable those who are interested in these topics to discuss the papers at length, two sessions will be devoted to steel and malleable work. The change in the session at which officers are elected was effected for the purpose of giving the new officers an opportunity to meet prior to the close of the convention for the purpose of outlining the ensuing year's work.

The committee on papers is actively at work and members desiring special topics discussed should send suggestions either to the secretary, A. O. Backert, Cleveland, Ohio, or to Harry B. Swan, chairman of the papers committee, Cadillac Motor Car Co., Detroit. The various committees appointed at the last annual meeting are also at work, and many interesting and valuable reports will be presented.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## ENGINE LATHE WITH QUICK-CHANGE GEARS.

THE description and illustration refer to an engine lathe with quick-change gears, made in two sizes, 16 in. and 18 in., by the Canada Machinery Corporation, Galt, Ont. It is quite a modern type high-speed tool, embodying great strength and capable of securing high degree accuracy in production.

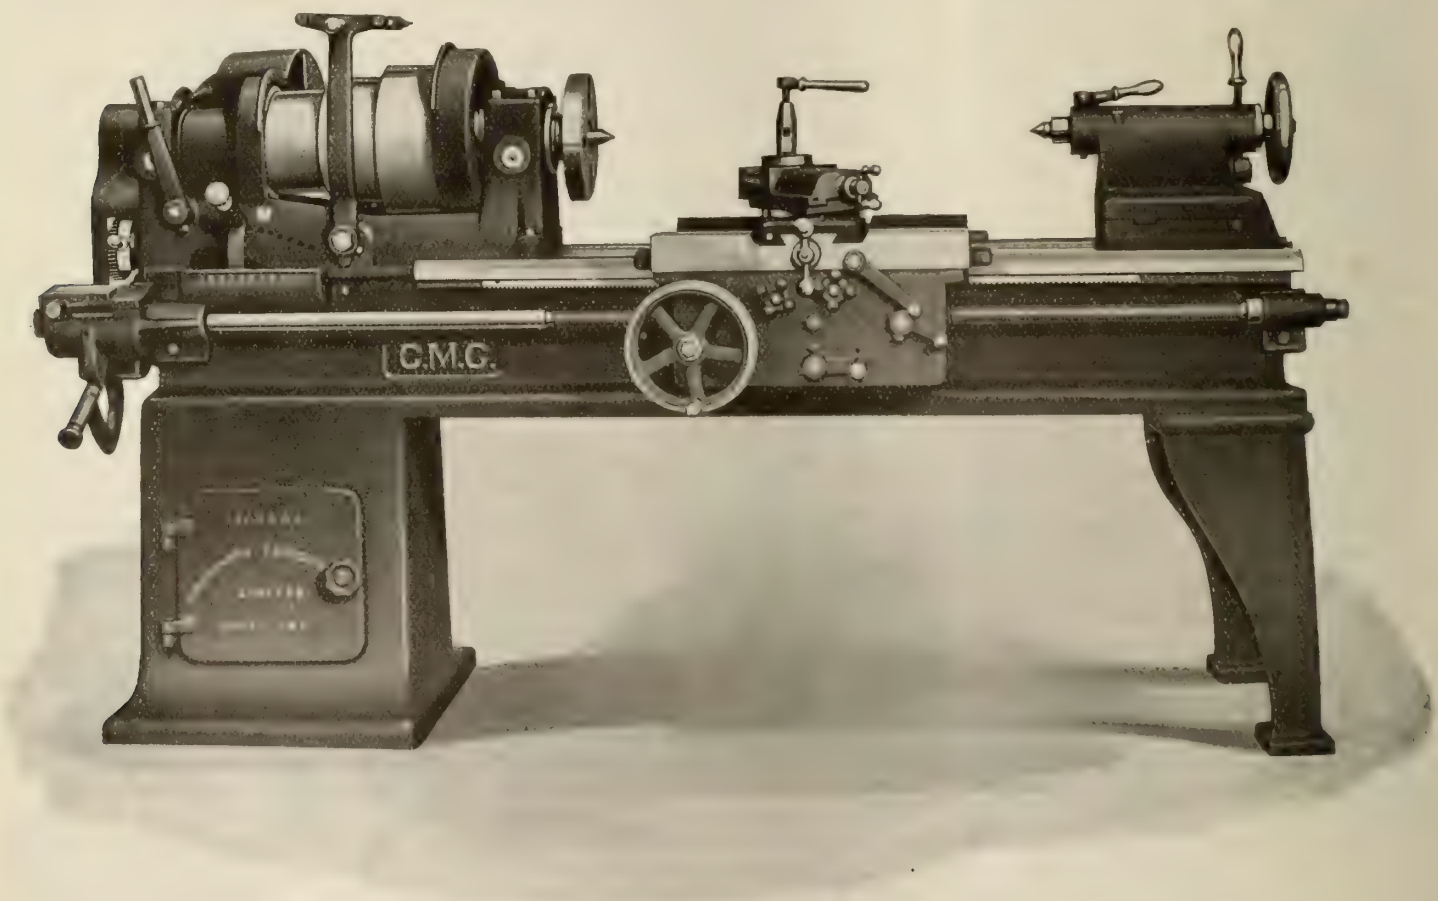
It is provided with a heavy deep bed, giving maximum stiffness under the cut. The saddle is substantial throughout, with great strength in the bridge, the latter having a bearing on the flat surface inside the front V in addition to the two V bearings. The headstock is of the three-step cone double-back geared type with extra wide belt, and is provided with a belt shifter. This belt shifter, besides saving time, forms a safety device preventing injury to the operator; his safety is further provided for by the guarding of all gears. The quick-change gears enable any threads from 2 to 64 to be cut without calculation or removal of gears. The machine in detail is as follows:—

The bed is unusually deep and rigid, and is thoroughly braced with cross ribs of box section. It is provided with three inverted V's of liberal proportions. The headstock and the tailstock each rest on one V and one flat surface, and the saddle bears on two V's and also on the flat surface. The brackets attached to the bed are made with a tongue fitting a groove in the bed, and the rack is of steel securely screwed and dowelled to the bed. The box leg under the headstock is hollow and provided with convenient shelves for holding extra parts.

The headstock throughout is unusually massive, and is of the three-step cone double-back geared type. It is equipped with split phosphor bronze bearings, which are provided with large oil wells to ensure ample lubrication at all times. The spindle is turned and ground to size from special high carbon spindle steel, and has a hole bored from the solid throughout its entire length. The cone has extra wide faces to enable wide belts to be used.

An improved belt shifter, for rapidly and safely shifting the belts to any of the steps of the cone, is part of the regularly furnished standard equipment. It consists of an arm bolted to the head carrying a belt guide and provided with a self-locking pin for securing the arm centrally over each step. A corresponding shifter is provided on the countershaft, and by means of the manipulation of these levers, the belt may be shifted to any desired cone step in the minimum time without the operator endangering himself in the slightest.

The feeds and screw cutting changes are instantly obtainable by the movement of a lever to any of the different locations as shown on the index plate. It is impossible to engage either the automatic cross or longitudinal feeds when the machine is set for screw cutting or vice versa. The thread of the lead screw is used for screw cutting only. The feeds may be instantly reversed in the apron by a convenient



16 IN. AND 18 IN. ENGINE LATHES WITH QUICK CHANGE GEARS.

lever. The saddle is securely clamped when using the cross feed, and the lead screw is reversed for right and left-hand threads by means of the reverse plate on the head. For indicating correct point for engaging nut for thread cutting, a thread chasing dial is provided on the carriage, obviating the necessity for stopping the lathe when screw cutting. Micrometer adjustment is provided on the handles of the cross screw and compound rest graduated in 1/1000ths and 1/16ths of an inch. A compound tool rest is provided, with base graduated in degrees. The tailstock is rigid and heavy, and is clamped to the bed by a locking lever conveniently situated. It is so shaped as to permit compound rest to be set at right angles without interfering. The spindle is graduated in fractions of an inch for use in boring.

Standard equipment includes countershaft with two friction pulleys, necessary shifters, special cone belt shifter, follow rest, steady rest, large and small face plates, necessary wrenches. Special attachments, such as taper attachment, turret on the bed or saddle, turret tool post, etc., can also be furnished. These lathes can, if desired, be arranged to be driven direct by constant or variable speed motor, or by single pulley drive. General specifications for the two sizes are as follows:—

| Design and operation features | 16 in. | 18 in. |
|---|---|---|
| Swing over shears | 16⅛ in. | 18¼ in. |
| Swing over saddle wings | 16⅛ in. | 18¼ in. |
| Swing over compound rest | 9¾ in. | 11 in. |
| Width of belt on cone | 3 in. | 4 in. |
| Speed of range spindle | 12 to 336 | 12 to 336 |
| No. of speeds to spindle | 18 | 18 |
| No. of thread and feed changes | 50 | 50 |
| Feed range | 4 to 128 | 4 to 128 |
| Thread range | 2 to 64 | 2 to 64 |
| Weight of machine complete, with 6 ft. bed | 2,100 lbs. | 2,750 lbs. |
| Weight of each extra 2 ft. bed | 150 lbs. | 200 lbs. |

## DIRECT-CONNECTED EXCITERS.

A SINGLE great reservoir of power, to be drawn upon as required, was once believed by power plant designers to be the ultimate development of the central station. Carrying out this idea, all of the generators were to be connected to one bus-bar and would be excited from a central direct current system. However, as central stations were built in increasing capacities, the necessity for sub-division on account of excessive short-circuit currents became manifest.

The present tendency is to lay out the station as a number of independent units, so that trouble on part of the system will not cause a shut-down of feeders and apparatus other than those directly affected. Especially is this trend noticeable in the case of hydro-electric plants where the power is used over a wide territory, and must be delivered over long transmission lines, which are particularly liable to trouble. To render each generator unit independent, many engineers—among them P. M. Lincoln, president of the A.I.E.E.—now favor the use of individual exciters, each connected to its own generator.

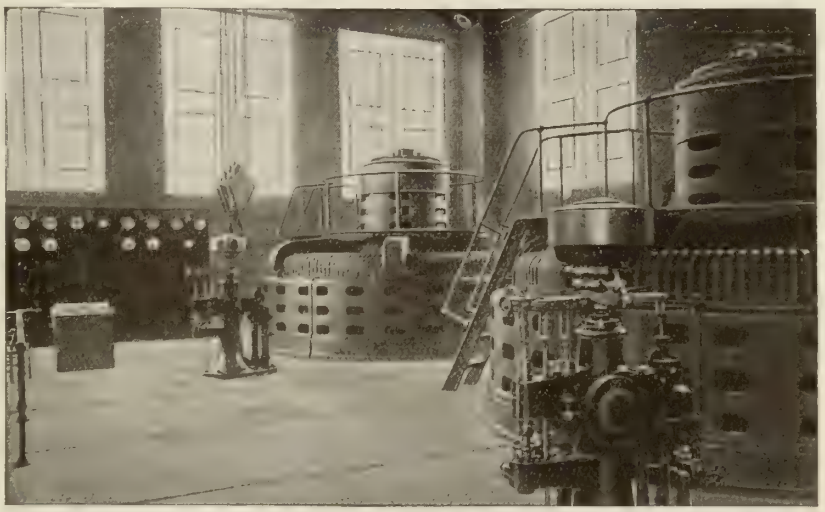


FIG. 2. HYDRO-ELECTRIC INSTALLATION WITH DIRECT CONNECTED EXCITERS.

The Westinghouse Electric and Manufacturing Co. has perfected a line of exciters especially adapted for such service. The chief point urged against direct-connection is that trouble in the exciter necessitates shutting down the generating unit unless leads are provided for exciting the generator from some other exciter unit. Hence reliability is the primary requirement in exciters designed for direct-connection. Westinghouse designers have fully recognized this fact, and these exciters are characterized by rugged mechanical details and great overload capacity.

While these exciters are generally built especially for the particular generator to which they are to be attached, in the details of their design and construction they are similar to the standard Westinghouse engine and belt-driven direct-current generators. Several methods of mounting the exciter are employed. In the case of a vertical generator the exciter is carried by the thrust-bearing bracket. With a horizontal generator, the exciter frame may

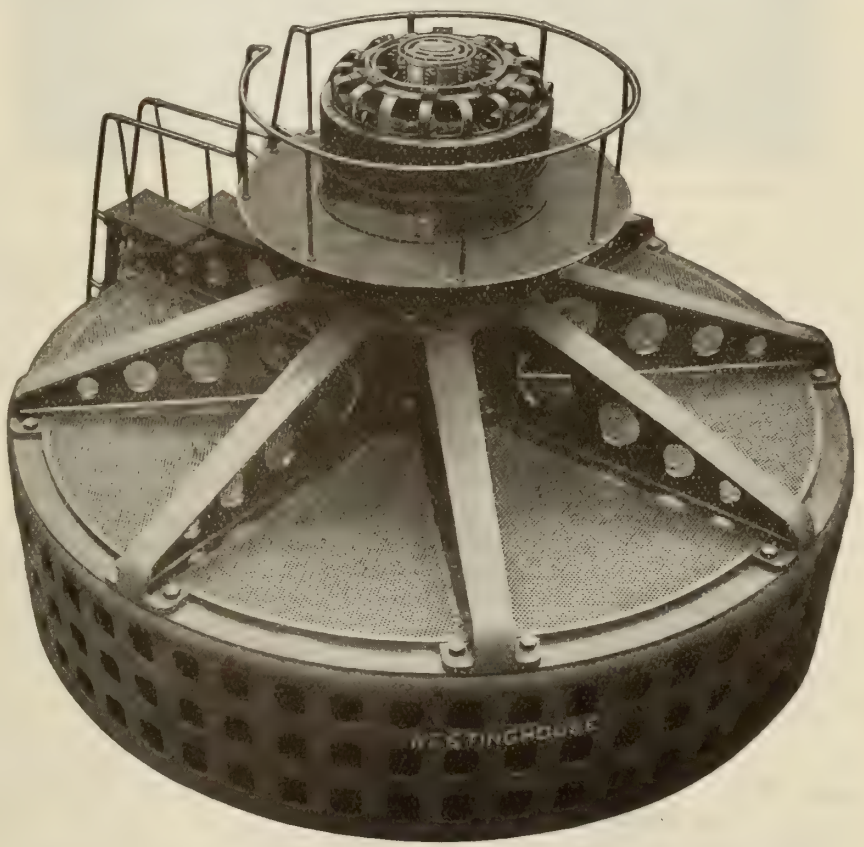

FIG. 1. DIRECT CONNECTED EXCITER ON VERTICAL GENERATOR UNIT.

be mounted on an extension of the generator bed plate, on a bracket attached to the bearing pedestal, or on a separate base.

The use of the direct-connected exciter has the following advantages:—Each generator is dependent only upon its individual exciter, the number of plant auxiliaries is reduced, rheostat losses tend to be less, belts and belting troubles are eliminated, and a neat and compact appearance is secured.

The cost of the direct-connected exciter varies somewhat with the type of main generator with which it is to be used. This is due to the varying amount of excitation required by the alternator, which depends materially on its operating speed. A slow-speed unit will require more excitation than a higher-speed machine of otherwise similar characteristics, and the slower the exciter runs the more expensive it will be. For this reason, direct-connected exciters for engine-driven sets or slow-speed water-wheels make a more expensive layout than where the higher-speed water-wheel, belted or turbo-driven generator is employed.

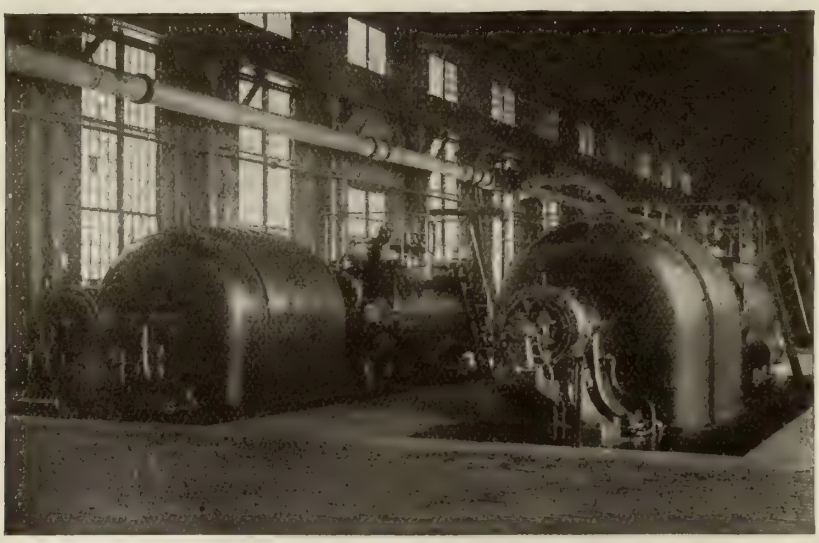

FIG. 3. HORIZONTAL TYPE GENERATORS WITH DIRECT CONNECTED EXCITERS.

In addition to the advantages of greater freedom from trouble, etc., it is frequently true that an outfit of direct-connected exciters will be cheaper than any other arrangement. This is particularly the case in hydro-electric plants where other arrangements, affording equal independence, entail a much greater first cost.

## LAKE FERRY "ONTARIO NO. 2" LAUNCHED.

THE large car ferry "Ontario No. 2" was successfully launched on April 3 from the yards of the Polson Iron Works, Ltd., Toronto. The ferry was christened by Mrs. Hugh Calderwood, wife of the consulting naval architect for the Ontario Car Ferry Co., owners of the vessel. The launching operations were superintended by William Newman, naval architect for the builders, who also supervised the construction of the ferry.

The "Ontario No. 2," like her sister ferry, "Ontario No. 1," will run between Coburg, Ont., and Charlotte, N.Y. She is designed principally for carrying coal cars, but will have, in addition, accommodation for 1,000 passengers on the upper deck. On the lower deck are four tracks of rails capable of taking 30 cars. A service is maintained between the Grand Trunk Railway and the Buffalo, Rochester and Pittsburg Railway. The dimensions and general particulars of the vessel are as follows:

Length, 318 feet; beam, 54 feet; depth from wheelhouse, 75 feet; moulded depth, 20 feet 6 inches; tonnage, 5,400; horse-power, 4,500; capacity, 30 loaded cars; launching weight, 2,100 tons; displacement of water at launching, 5,000 tons.

She is about the same size as her sister ferry, but built more heavily and with capacity for four more cars.

Twin sets of jet condensing triple expansion engines are being installed, each having cylinders 20½ in.-33 in., and 54 in. diameter by 36 in. stroke, and making 110 r.p.m. The boilers, of Scotch type, are four in number, each being 14 ft. diameter by 12 ft. long. Howden's forced draft is a feature of the boiler equipment. The electric lighting plant will consist of two direct-connected steam-driven generating sets of 15 k.w. and 20 k.w. respectively of Canadian General Electric Co. make.

The vessel bows are constructed for ice-breaking, and lifeboat and raft equipment carried on the top deck.

Captain Forrest, of Coburg, will be in command of the ferry, and Allan Nichol will be chief engineer.

At the conclusion of the launching ceremony, a buffet luncheon was served in the Polson Ironworks' offices, the guests being received by the president of the company, Col. J. B. and Mrs. Miller. Among those present were: Mr. and Mrs. Hugh Calderwood, Howard E. Kelly, vice-president G. T. R.; Col. and Mrs. J. B. Miller, A. H. Jeffrey, secretary of the company; Mayor Church, Toronto; Captain H. H. Miller, J. W. Greiner, chief engineer of the G. T. R. ferry system; J. F. McMillan, of the Kingston Shipbuilding Co.; W. Inglis, of John Inglis & Co., Toronto; Captain J. B. Foote, W. H. Smith, general manager of the Ontario Car Ferry Co.; G. A. Bowman, A.G.F.A. of the B. R. & P. Railway; Mr. and Mrs. William Newman, J. A. Sing, etc.

## COUPLING TROUBLE.

IN a factory where I was employed several years ago, says a writer in The Dodge Idea, there were two lengths of shafting coupled together with a compression coupling. This coupling gave quite a lot of trouble, as the nuts would work loose on the bolts and there would be a constant grinding of the shaft against the keys. The result was the keys would soon be cut away and the keyseat so badly damaged as to allow the shaft to turn in the coupling. Then the engine would have to be stopped, the belt thrown off and a new key made, and maybe a new keyseat cut.

The first time this trouble occurred was when the few machines on the line were not needed. I had the repairman make a joint in the shaft. By the use of a hack saw the two ends of shafting were cut a little more than half-way through, each being cut to the same depth. They were then cut in from the end on a bevel, and filed to a nice fit, forming a bevel lap joint. When the coupling was put on and the bolts screwed up tight, the trouble had disappeared.

Truth is an asset and a lie is a liability. Good business men tell the truth because it pays. We make money from our friends, not our enemies. The wise public service corporation gives the best service because in so doing it gets the best returns.

• • •

There are no yesterdays, except in that unquenchable influence they leave behind. Our to-days are the only vital segments of time that we can utilize. We have no assurance of any to-morrow. Keep the golden hours of to-day busy and set them with sixty active minutes.

## OUR WAR INTEREST A PROFITABLE INVESTMENT.

RECOVERY from the shock produced by Britain's declaration of war against Germany and Austria induced our business interests to at once set about instilling into the minds of their employees and the public generally the instruction to become oblivious of the conflict of nations and pursue their multifarious avocations with peace-time regularity and assiduousness. Under the then circumstances the propaganda was timely and the best possible. Nobody of even moderate intelligence, however, looked for any practical and lasting results, and the most that could then or can now be said in favor of the action taken is that it did produce in some degree the desired effect.

In spite of the fact then that it was well nigh impossible to banish war development interest, and that a well meaning attempt thereto was made, we have to-day not only become involved in a mental sense, easily transcending our initial display, but are engaged, to the almost total exclusion of every other consideration, in the practical work of "seeing the thing through" in a real Empire patriotism sense. When we say that Canada, agriculturally and industrially is devoting herself exclusively to the work of aiding Britain and her Allies to bring the war to its one and only desirable conclusion, we mean that our Dominion in its every feature is so committed. Other than for our own immediate needs, production is relative to the war requirements of our own, the Imperial and Allied Governments.

Agriculture over the length and breadth of our land has been stimulated as at no time previous in our history, and taking account of the prices ruling for the fruits of the soil, it needs no stretch of imagination to assume that given seasonable weather for the ensuing five months, even irrespective of bumper receipts by our farmers and transportation companies, and through them to our industries generally, a foundation will have been laid, both systematically and scientifically, from which hitherto undreamed of achievement and possibilities will arise.

Again, what is true of agriculture is equally so of industry relative to manufacturing. For other than war requirements our factories are doing little, and in no section is this more noticeable than in that of our machine tool and general engineering works. A like condition exists, but of a still more realistic kind in similar plants in the United States. It may be urged and quite reasonably that with respect to the production of shrapnel shells on which so many of our engineering establishments are now engaged, we are apt to draw comparisons which place normal or peace-time production in an altogether unwarrantably unfavorable light.

Whether such be only a tendency or an unquestionable reality, shell manufacture in our leading plants may aptly be classed as booming. The way in which those who direct our engineering and steel production enterprises have grasped the opportunity afforded by the war, and are making good on the more or less accurate workmanship and material quality output called for by the shell specifications leads us to conclude that greater commercial achievement and possibilities are in future store for these particular concerns.

New equipment of the most up-to-date type for shell making has been lavishly installed, and standard equipment with ingenious and easily applied attachments and devices has also been largely and effectively utilized. Operators have become enthused—for personal and patriotic reasons, and not in the least because of the exceeding novelty of the product and the rapidity with which finished shells materialize from their craftsmanship.

The net result to our iron and steel industries will be to stimulate a desire to maintain a higher grade equipment installation and give spirit to our mechanics to cultivate a higher degree intelligence.

# The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

**Montreal, Que., April 5, 1915.**—The approach of the opening of navigation is a new factor which has added a distinctly better tone to the market for lines for outside consumption. As yet it cannot be said that the volume moving has materially increased but there is a comparative optimism in the inquiries being received. That the improvement will be lasting is questionable but it is the belief that the hand-to-mouth policy adopted with the outbreak of the war has resulted in stocks being starved to the minimum and that there should now be some buying, particularly with the means of facilitating transportation at hand. The field for ammunition manufacture is evidently widening and with it the demand for metals is well maintained, despite the fact that the situation shows some tendency to ease off. Inquiries for certain lines of tools continue active from the same cause. The steel trade continues to drag. Price changes are not important.

#### The Steel Trade.

The volume of business passing continues small, and the consumption of heavy materials is expected to continue so, there being little indication of heavy industrial or transportation demand.

Opening of navigation this year is not likely to affect either demand or prices. Some of the mills are watching the American situation with itnerest in view of the rail orders secured by the Algoma Steel Co., and they find encouragement in the tone on the other side of the line. Whether more rail business will come this way or not remains to be seen but, although price competition is likely to be even keener now that the American makers have been aroused, report has it that Canadian concerns are hopeful of bringing further orders this way.

Ammunition orders continue as the chief matter of interest for the majority of the steel plants capable of making shells, and the outlook for continued business seems to improve steadily as the war progresses without definite indication of early cessation.

### Pig Iron.

The situation shows little change during the week and prices remain on the same basis. Some little improvement in tone is indicated in relation to the approach of the water transportation season.

### Machine Tools and Supplies.

The field for the manufacture of shells is widening with the continued demand and this has been noted particularly in connection with the recent big business placed with the Canadian Car Co. by the Russian Government. Officials of the company report that they are going to be able to place much more of the business on this side of the line than had at first been anticipated. The consequence is that the demand for equipment is broadening. The fact that machine shops in practically all parts of Western Canada are getting ammunition orders is significant.

### Metals.

The manufacture of shells continues to drain the metal markets to some extent and although tin is quoted off a couple of cents and spelter is inclined to be easier, antimony shows a slight advance and there is little to indicate that materially lower prices are to be looked for while the war demand continues. Tin is quoted at 54c. New York has reported easier conditions for a week or so, but each decline has been met by a reaction which has recovered much of the loss.

Spelter continues at 12c, but there are some quotations which shade under this figure. St. Louis recently suffered quite a marked reaction but the low price was evidently the result of manipulation just as the previous high had been, and there were indications that the basis was merely nominal, practically all makers delivering on placed orders at higher figures. Lead continues strong and prices are inclined to go higher, 5¾c being quoted in some instances. Antimony is advanced to 23c, an increase of 1c. The advance comes at the same time as a decline is noted in New York, but for some time the price here has been materially under that quoted in the States.

---

**Toronto, Ont., April 6, 1915.**—During the past week there has been less activity in business circles owing to the Easter holiday season. Industrial conditions are, however, improving gradually, although the volume of business is not equal to last year at the corresponding period. The approach of spring is tending to stimulate business in some trades apart from the orders for war material which are still keeping an increasingly large number of factories busy. One trade which should now be showing an improvement is particularly dull, that is, the building trade. The local building returns for March, 1915, are a long way behind those of the corresponding month last year. The same remark applies to the months of January and February.

The returns for the fiscal year just ended show a large decrease in customs revenue, representing nearly 28 million dollars. Part of this falling off is attributed to scarcity of ocean tonnage, although there has been a decline in imports from the United States. Sir George Foster, Minister of Trade and Commerce, has announced that a campaign will shortly be started to promote trade between Canada and Russia. The campaign will be conducted by Conrad F. Just, former Trade Commissioner of the Dominion in Germany.

### Steel Market.

There has been a quiet week in the steel market, but indications point to a gradual improvement in trade. This is largely due to orders for war supplies which are increasing in volume and are to some extent making up for the ordinary business lost owing to the war. The shell industry is responsible for the bulk of the new business, but development is taking place in other lines and will materially benefit the steel trade. Billets, wire rods, nails and forgings are being shipped in considerable quantities to England. It is reported that W. C. Franz of the Algoma Steel Corporation is negotiating with the Pennsylvania Railroad for an order for steel rails and if successful, that mill will have all the tonnage it can take care of for some considerable time.

Conditions in the steel trade in the States have materially improved and large orders for finished and semi-finished steel have been booked for shipment to Europe.

### Machine Tools.

Machine tools for making shells continue to be the most interesting feature, although the ordinary business is beginning to pick up. Many inquiries are being received by local dealers for shell equipments but satisfactory deliveries are very difficult to obtain as nearly all makers of tools are full up with orders. Tenders close on Friday for tools not already awarded for the new Technical School. A number of milling and woodworking machines, foundry equipment and electrical apparatus are included.

### Supplies.

Although the volume of business booked has been curtailed to some extent on account of the holidays, indications point to an improvement in trade. The market is steady and there are no price changes to note.

### Metals.

The metal exchanges in London and New York have been closed for the Easter holidays. With the exception of copper and tin, most markets are showing a weak tendency, but quotations are unchanged.

**Copper.** — The copper market is strong and the general situation unchanged. Lake copper is quoted at 16¾c per pound.

**Tin.**—The market is steadier to-day in London and stronger. The general situation, however, shows practically no change. Tin is quoted at 54c per pound.

**Spelter**—The spelter market is weaker in London to-day. Local quotations are unchanged and nominal at 12c per pound.

**Lead.**—The market has weakened but quotations are unchanged at 5¾c per pound.

**Antimony.**—The antimony market is very quiet and there is very little change in the general situation. Local quotations are nominal at 25c per pound.

**Aluminum.**—The market is steady and quotations unchanged at 23c per pound.

## WAR SUPPLIES CONTRACTS IN UNITED STATES.

ACCORDING to recent Washington advices, United States Government officials are unable to give anything like correct figures of the business being done in war supplies. A large proportion, how large it is impossible to say, goes to Canada first and is shipped from there to England, France and Russia.

In the most authoritative circles it is estimated that the principal items in the $400,000,000 worth ordered in America in six months were:—Motor cars, $25,000,000; arms, explosives and the like, $105,000,000; iron and steel, $65,000,000; uniforms, socks, sweaters, etc., $30,000,000; chemicals and hospital supplies, $6,000,000; soldiers' shoes, harness and

other leather products, $18,000,000; miscellaneous, including food supplies known to have gone to the armies, $160,000,000.

It can be said without fear of contradiction, says Steel and Iron, that the Allies have now contracted for the entire output of the arms and ammunition factories of the United States, while scores of concerns are enlarging their plants and running three shifts a day to fulfill their foreign contracts.

### Noteworthy Features.

Many of these companies do not know they are turning out goods for a foreign power. They pretty well surmise it, however, and they don't care. They deal only through a broker or agent and with great secrecy.

Goods are sold for delivery here and shipment is at the buyers' risk. The buyer enforces secrecy, because the goods are contraband. The manufacturers surround their plants with high fences and troops of armed guards, not only in order to co-operate with the buyers, in maintaining secrecy, but also to prevent meddling by agents of governments hostile to the buyers. The 75 firearm and ammunition factories in the United States ordinarily employ 20,000 persons. Now their forces number 50,000 and are increasing.

### High Explosives Demand.

The enormous demand for high explosives has forced prices to high levels. Picric acid, used in the making of explosives, has risen from 25 cents to $2.50 a pound, and the entire supply on hand has been bought up. Those men who still have guncotton on hand which can be delivered within 30 days are asking 78 cents a pound. The usual price is 20 to 25 cents. In February, the French Government tried to buy 24,000,000 pounds of gun cotton, offering 65 cents. It was unable, so contracts were placed with a number of mills running over two years.

More than 10,000 automobile trucks have been shipped to England and France since August 1 last, but from the way new orders are coming in, this branch of the trade is only just beginning. The French war authorities figure the average life of an auto truck is only seven days.

### Chief Buying Agents.

Their are thousands of buying agents for foreign governments all over the country, but the largest contracts are coming through Charles M. Schwab, or the Bethlehem Steel Co., and J. Pierpont Morgan, head of the New York banking firm. Mr. Schwab has made two visits to Europe since the war began and has obtained contracts amounting to more than $50,000,000. His Bethlehem works are making 12-inch guns for the Allies, but, in addition to what is turned out there, he has sub-let orders in a dozen different cities. Morgan is now the general purchasing agent of the British Government and all orders go through his firm. Every section of the country, where manufacturing is a feature is benefiting from war orders, although these in many cases are not large enough to offset the depression existing in domestic lines.

### New U.S. Markets.

Many orders are from governments which never before bought in the United States market, and American business men believe they can hold this trade after the war is over. They argue that much of the work now being done here for Great Britain, to take an instance, has previously been done in Germany, and that the bitter feeling arising from the war will preclude its being done there again.

### ALLIES PURCHASING AGENTS.

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**British.—Lieut. Johnston and A. C. Billing, Ritz Carlton Hotel, Montreal.**

**French—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**

**Russian — Messrs. S. Ruperti and Aiekieff, care Military Attache, Russian Embassy, Washington, D.C.**

A Philadelphia factory is making swords for the British army. Such a contract had never been received in the United States. In the past, British swords have been made in Germany.

In the Pittsburgh district, at Homestead, many Germans who formerly worked for the Krupps are employed. They are now making war material for the Allies, although, of course, they do not know this definitely. The men in the factory are not informed for whom a particular 6-inch shrapnel shell is being made.

### Miscellaneous Contracts.

Some odd items are reported. The French Government has paid New England manufacturers $260,000 for snowshoes. One concern in Philadelphia is turning out a folding saw with wooden handles for cutting wire entanglements. When the war started, the Armies used steel pliers for this work, with the result that many men were shocked to death by high voltage electricity.

All sorts of factories have been pressed into commission to make things useful in war. A company in Bridgeport, Conn., which usually makes cemetery monuments of bronze, is now turning out forgings for an auto truck concern, which has a large order from the Allied Countries. Bridgeport, by the way, is enjoying huge prosperity because most of its industrial concerns are working on war orders.

All through Massachusetts and Connecticut war orders are helping to overcome the depression of the first few months of the war. The Fore River Shipbuilding Co. is very busy. It is generally reported to be building 10 submarines for the British Navy, these to be delivered at end of the war. In addition it has 25 others building.

### Brokers and Middlemen Fattening.

Demand for many particular articles has been so great that the Allied Governments have signed contracts at prices most attractive for the manufacturers. In addition, it is pretty well established that middlemen, brokers and agents are gathering millions in commissions, some of which are exorbitant. It is said by a Chicago merchant, for instance, that there is a well-organized band of extortionists, with agents in all the big cities on both sides of the Atlantic and headquarters in New York, which is exacting a toll of from 15 to 20 per cent. on practically every shipment of war supplies that leave the country. In general, however, the agents of each government maintain that their nation is buying right, while stating a belief that other nations are being fleeced. A well-known Russian exporter of New York City says the Russian Government is suffering the most heavily of all. He has sent over a report for wide publication in Russian in which he says that already $20,000,000 has been lost through the exploitation of American commissioners and brokers.

England is financing purchases through the house of J. P. Morgan & Co. Russia, on the other hand, sends over her various bureaucratic officials and military and governmental officers who know nothing whatever about American business methods, and in many cases do not even speak English language. They come straight from the offices of the Ministries of War, Industry, Communications and Finance.

### MUSSEN'S, LTD.

WE are officially advised that John J. Robson has been appointed permanent liquidator of Mussen's, Ltd., and that the firm's application to continue the conduct of the business for a period of

six months has also been granted. Further to the above, we cannot do better than refer to the candid and highly commendable spirit with which the management of this old-established concern is getting to work, to not only offset and overcome its present difficulties, but to bring about the return of its old prestige on a basis more substantial and efficient than perhaps attainable in times less strenuous than the present. We quote from the official statement over the signature of W. H. C. Mussen, president of the company as follows:—

"We take this opportunity of stating that we feel able to demonstrate to our creditors that we will succeed in the efforts which will be put forward to reduce our stock, collect our open accounts and materially reduce overhead charges, with a view to getting into a position to reorganize and continue in business. While we are in liquidation, we are carrying on an active campaign for business, and we trust that we may continue to receive your support. We have a good connection throughout the country and all purchases made by us from now on will be paid for by the liquidator. Operating as we are, under the most strenuous conditions which have ever existed in Canada, we know that it will take some time to achieve the result at which we are aiming, but if we continue to receive the support of our principals as in the past, we are satisfied we can show good results and ultimately re-establish this business on its old footing.

"Since the liquidation proceedings were put into effect, we have been flooded with letters from manufacturers, as well as from our customers, extending their hearty support and assuring us of their continued patronage. We, therefore, take this opportunity of thanking our friends for this evidence of confidence in us and in our ability to win out. We also desire to impress upon our customers the fact that we are carrying on 'business as usual,' and that, although we were always pleased to receive their orders, we are now more anxious than ever to be favored with same.

"We conclude by asking our principals to continue the support which has been so freely given us in the past, and we ask our customers to give us an opportunity of supplying them with any material which they may require. All inquiries will be promptly attended to and orders will be filled without delay."

**Canada's War Orders.**—An official memorandum regarding war orders states that at least ninety-five million dollars' worth of war material and equipment has been ordered by the Allies from Canada, and that this expenditure does not include that incurred on behalf of the Canadian contingents, which exceeds twenty-five millions. Seventy-two Canadian companies have been given orders for machining shrapnel shells, and 67 are engaged in making the various parts required. The orders placed in the United States amount to more than a billion dollars.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

# INDUSTRIAL AND CONSTRUCTION NEWS

**Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.**

## Engineering

**Bedford, Que.**—The Bedford Mfg. Co. will build an extension to their plant.

**Ottawa, Ont.**—The city will equip a machine shop for the fire department.

**Toronto, Ont.**—The Martin Pump & Machine Co., Davies avenue, have received a contract for shells.

**Brantford, Ont.**—It is stated that the Steel Company of Canada will make shrapnel shells at their plant here.

**Toronto, Ont.**—A building permit has been issued to the St. Clair Foundry Co. for the erection of an addition costing $2,000 to their plant.

**Stratford, Ont.**—The Bartlett Motor Co., of Toronto, will probably establish a plant here. A by-law will be submitted to the ratepayers.

**Charlottetown, P.E.I.**—It is announced that Bruce Stewart & Co., will rebuild their foundry and blacksmith shop, which was recently destroyed by fire.

**Cowansville, Que.**—Messrs. Lemay, of Dunham, and Lenou, of West Brome, have taken over a plant for the purpose of re-establishing a machine shop and garage.

**Belleville, Ont.**—The Marsh & Henthorne Co., of this town, has secured a contract to supply 5,000 eighteen pounder high explosive shells for the British Government.

**Moose Jaw, Sask.**—The Saskatchewan Bridge and Iron Co. may be awarded a contract for shrapnel shells. In this event the Canadian Automobile and Tractor Co. plant would be taken over and equipped with the necessary tools.

**St. Mary's Ont.**—The Water, Light and Heat Commission has recommended the purchase of a gasoline-driven pump for the power house, and Chairman Richardson and Commissioner Sanderson, will carry the suggestion to the Town Council.

## Municipal

**Meaford, Ont.**—The council have appointed F. W. Thorold & Co., Toronto, engineers for the proposed waterworks extensions.

**Hespeler, Ont.**—The by-law to fix the rate of assessment on the Stamped Enamelled Ware Co. factory at $64,000 was defeated on March 29.

**Dundas, Ont.**—The Public Utilities Commission is at work on a new plan for waterworks extension, which will provide for a reservoir or storage basin, in addition to the one now in use.

**Brampton, Ont.**—At the Town Council meeting held recently, the tender of Goldman & Co. for waterworks extension was accepted, their offer being for the sum of $10,063 and accrued interest.

## Electrical

**Kincardine, Ont.**—Improvements to the street lighting system are contemplated.

**Ottawa, Ont.**—The city council have been granted permission by the legislature to raise $50,000 for extensions to the electric lighting system.

## General Industrial

**Vancouver, B.C.**—The National Biscuit Co. factory was damaged by fire recently.

**Medicine Hat, Alta.**—The Lake of the Woods Milling Co., will build an extension to their elevator to cost $2,000.

**Kelowna, B.C.**—It is reported that D. W. Sutherland of this town, contemplates establishing a broom factory here.

**Hamilton, Ont.**—The Grasseli Chemical Co., will extend their plant at a cost of $27,000. A building permit has been taken out.

**Dundas, Ont.**—It is announced that the Canadian Hart Wheel Co., of Hamilton, may begin the construction of a plant here in the near future.

**Brantford, Ont.**—The Brantford Computing Scale Co. will extend their plant. The new building will be 45 ft. by 130 ft., two storeys high, and will cost about $20,000.

**Schumacher, Ont.**—Timber is now on the ground for the construction of a mill on the Schumacher Syndicate property. The mill will have a capacity of 150 tons daily. It will be completed some time in August.

## Contracts Awarded

**St. Thomas, Ont.**—The City Council has awarded the contract for municipal supplies to Ingram & Davey, Ltd., of this city, at $418.22.

**Hamilton, Ont.** — The Gartshore-Thomson Co. has been awarded the contract for 26-in. cast iron pipe, the price being $31.75 per ton.

**Regina, Sask.**—The Regina Foundry Co. has been awarded a contract by the city for the steel work for the sewage disposal plant, at $1,640.

**St. John, N.B.**—The British War Office has placed an order for ten thousand 4.5 high explosive shells with T. McAvity & Sons, St. John, N.B.

**Toronto, Ont.**—The Board of Control has awarded the following contract to the Turbine Equipment Co.: 36-in. stop valves, at $541 each; 30-in. stop valves, at $392 each; 24-in. stop valves, at $285 each, and one 36-in. check valve, at $855.

**Saanich, B.C.**—Council has awarded the following contracts: — Balfour, Guthrie & Co., pipings and special castings; the Victoria Machinery Co., 100 hydrants at $33 each; Yarrows, Ltd., 100 hydrants at $35 each; the Rensselaer Co., 25 hydrants at $37.25 each.

## Tenders

**Winnipeg, Man.**—Tenders are being called for a 5,000,000-gallon turbine pump and motor. M. Peterson, secretary Board of Control.

**Toronto, Ont.**—Tenders will be received, up to Tuesday, April 13, 1915, for constructing an incinerating plant on Centre Island. Specifications and form of tender may be obtained at the Street Commissioner's Office, City Hall.

**Toronto, Ont.**—Tenders will be received up to Tuesday, April 13, for the supply and installation of an asphalt tank for city asphalt plant. Specification and forms of tender may be obtained at the Works Department, City Hall.

**Toronto, Ont.**—Tenders will close on April 9 for machinery and tools for the new Technical School not already contracted for. A complete list was given in Canadian Machinery in our issue of March 4. The principal equipment required includes: Milling and planing

machines, woodworking machinery, foundry equipment and electrical apparatus. Specifications at the Technical School, 149 College Street, Toronto.

# Trade Gossip

**The National Cash Register Co.** has been granted a supplementary license to use in Ontario capital to the extent of $800,000.

**The Canada Machinery Corporation,** Galt, Ont., have been given powers to increase their capital from $1,500,000 to $2,000,000.

**Port Arthur, Ont.**—The Western Drydock & Shipbuilding Co., of this city is filling an order for 15,000 shrapnel shells for the Imperial Government.

**Order for Gun Cotton.**—We understand that the Canadian Explosives at Nobel, near Parry Sound, Ont., have secured a large contract for the manufacture of gun-cotton.

**F. W. Thorold Co.,** consulting engineers, Toronto, have been retained by the town of Port Hope, Ont., to prepare plans for a new sewage and sewage disposal system.

**Lyddite Shell Order.**—It is understood that the Record Foundry & Machine Co., Moncton, N.B., which recently received a big order for lyddite shells has closed negotiations for the purchase of the required machinery.

**C. F. Todd,** a Markham manufacturer, has received his third contract for army supplies, this time for artillery saddles. The contract calls for an expenditure of $7,500, and will be completed in a short time.

**Campbellford, Ont.**—The Government inspector was here recently and inspected the plant of the Dickson Bridge Works Co., with a view to the manufacture of shrapnel shells, and reported that everything is in satisfactory condition.

**Errata.**—In our description of the Quick Change Speed Sensitive Drill Press, which appeared on page 196 of our March 11 issue, the address of the Sipp Machine Co., was inadvertently given as Paterson, N.Y., instead of Paterson, N.J.

**T. A. Willson & Co., Inc.,** Reading, Pa., manufacturers of eye protectors and goggles, were awarded a grand prize at the Second International Exposition of Safety and Sanitation recently held at the Grand Central Palace, New York City.

**The Turbine Equipment Co.,** Toronto, have recently been awarded a contract by the town of Sydney, C.B., for the supply and installation of one De Laval 3½ million gallon centrifugal pump, direct connected to one 125 h.p. Canadian General Electric Co. motor, complete with C. H. Wheeler rotrex motor driven priming pump, etc.

**Convention Notice.**—The ninth annual convention of the Illuminating Engineering Society will be held at the New Willard Hotel, Washington, D.C., September 20-23 inclusive. E. S. Marlow, of the Potomac Electric Power Co., Washington, D.C., is chairman of the convention committee. The schedule of sessions, papers, etc., will be announced later.

**Allison Contracts.**—The Allison Supply Co. of Canada, announce that they have let contracts with United States manufacturers for 535,000,000 rounds of ammunition for the European Allies. The company has contracts pending for 500,000,000 additional rounds of ammunition. J. Wesley Allison, of Morrisburg, is stated to be the head of the company.

**Artillery Equipment Orders.** — The Dominion Chain Co., Niagara Falls, Ont. has received two large war orders, one from the British, and the other from the French Governments. The Falls plant will make buckles and other equipment for the British artillery forces at the front. The French Government has placed orders for a large amount of artillery hardware.

**The Canadian Fairbanks-Morse Co.,** Toronto, have sold to the Water Commissioner of Port Hope, Ont., the following pumping units for the proposed waterworks extensions: One 10 h.p. oil engine, driving a 800-gallon centrifugal pump. The engine operates on distillate. One 600 gallon vertical, and one 250-gallon horizontal centrifugal pump (motor driven). F. W. Thorold & Co., engineers, Toronto.

**Montreal ,Que.**—An order calling for two million oat sacks and valued at $425,000 has been distributed among Canadian firms by Col. Barton, resident purchasing agent of the Imperial Government. Delivery of the material is requested to be made as quickly as possible, and Col. Barton stated that he expected immediate shipments of large quantities to go forward. The order for two million sand bags has not yet been placed as some further details from the War Office are being awaited.

**Customs Revenue Decline.**—The fiscal year, which ended on March 31, shows a decrease of $27,882,233.53 in the Customs revenue. The grand total was $78,261,535.41, as against $106,143,768.94 in the corresponding year. To the scarcity in ocean tonnage is attributed largely the falling-off of $646,521 in the March figures, though this does not account for the decline in imports from the United States. The revenue for the month was $7,356,125.21, as against $8,002,646.28 in March of last year.

**Tariff Gossip.**—Canada has raised the duty on machine tool imports from 27½ per cent. to 35 per cent. ad valorem. Why? Because in Canada, as in the United States, the demand for ammunition and other munitions of war has resulted in tremendous purchases of machine tools and the Dominion Government wishes to make it certain that as many of these tools will be furnished by Canadian manufacturers as possible. It is significant, also, that there has been no tariff agitation in Canada. Conditions simply were ripe for an additional duty and it was at once put into effect. We in the United States, says the Iron Trades Review, still have a few things to learn from our cousins across the border in quick, businesslike way of doing for the public.

# Personal

**Sir William Price** has resigned from the post of president of the Quebec Harbor Commission.

**A. S. Rendall,** of St. John's, Nfld., has been appointed a director of the Nova Scotia Steel & Coal Co.

**W. M. Weir,** of Montreal, president of Canada Foundries and Forgings, Ltd., is leaving for Halifax to take a military course there.

**John G. McBeath,** for many years manager of the Woodstock, Ont., branch of the Canada Furniture Manufacturers, Ltd., is retiring.

**Charles Warnock** has been appointed manager and treasurer of Robert W. Hunt & Co., Montreal, succeeding Charles C. Whittier, transferred to the Chicago office.

**J. W. Borden,** accountant and paymaster-general of the Canadian Militia Department, and brother of Premier Borden, has been added to the membership of the Shell Committee.

**Alexander Bower,** who for over fifty-five years had been general superintendent of the Canada Sugar Refining Co., Ltd., Montreal, died on March 30. Mr. Bower, who was born in Edinburgh eighty-one years ago, came to Canada in November, 1834. He retired from the company two years ago.

**BUTTERFIELD & CO., INC.** Rock Island, Que. and Derby Line, Vt.

**George William Gaden**, manager of the Gaden-Hillock Revolving Door Co., of Canada, died on March 31, at his home in Toronto. The deceased was born 73 years ago in St. John's, Newfoundland, and was a pioneer of revolving doors in Canada.

**Martin Todd**, of Galt, Ont., has been appointed, provisionally, to succeed W. P. Kellett, manager of the Lake Erie and Northern Railway, Mr. Todd is president and general manager of the Galt, Preston and Hespeler Railway. Mr. Todd has been directed by C. P. R. officials to investigate the advisability of electrifying the L. E. & N., in the event of which he will be retained as manager of both roads.

**James Currie**, marine engineer of 71 McGill street, Toronto, died on March 31. Mr. Currie was the son of James Currie, sr., who, with his brother, Neil, founded the Currie Boiler Works, now known as the Polson Iron Works. He was born Feb. 6, 1852, at Dundas, Ont., but came to Toronto when very young, practically all his life having been spent here. Mr. Currie was a member of the Marine Engineers' Association.

**William Burrill**, of the firm of William Burrill & Co., Yarmouth, N.S., died there on Friday morning, March 26 aged 74 years. Mr. Burrill was a native of Yarmouth, and, in the days when ship building in Nova Scotia was active, he and his firm were indentified with the industry, many fine craft being constructed in their shipyards at Meteghan and along the coast. Latterly the firm has been engaged in ship chandlery and outfitting business.

**William Stitt**, general passenger agent of eastern lines of the C. P. R., died suddenly on April 1, at the Windsor street station, Montreal. Mr. Stitt was born in Scotland in 1855, and came to this country as a young man. He joined the service of the C. P. R. in Winnipeg as a clerk in the passenger department in 1888. In 1901 he was given the office of general passenger agent for the C. P. R. in Australia. Six years later Mr. Stitt came to Montreal to take over the office of general passenger agent.

## Railways—Bridges

**London, Ont.**—The contract for the new steel and concrete bridge over the Aux Sauble, at East Williams, has been awarded to D. Witherspoon for $6,600.

**Calgary, Alta.**—The construction of the Bassano-Coronation Railway, 110 miles in length, will shortly be commenced by the firm of Grant, Smith & McDonnell Co.

**Toronto, Ont.**—The Forest Hill Electric Bill, which was turned down by the Railway Committee of the Legislature on March 24, has been recommitted to that committee for further consideration.

**Toronto, Ont.**—The Dominion Railway Board has granted the application of the City of Toronto for the approval of its plans for the construction of a subway under the Grand Trunk tracks at the proposed extension of Wilton Avenue to connect with Dickens street.

**Toronto, Ont.**—Mayor Church states that "there is no hope of the railways starting the work on the new Union Station and the Esplanade viaduct." He has been informed that owing to the money situation it is impossible to finance the undertakings, which will have to wait until times improve.

**N. T. R. Operation.**—The first step toward State operation of the National Transcontinental Railway was taken last Saturday night, when Hon. Frank Cochrane, Minister of Railways, gave notice of a resolution authorizing the Government to lease or take over the Lake Superior branch of the G. T. P., extending from Lake Superior Junction to Fort William. The lease or acquisition of this line will include all terminal facilities and accommodation works. The resolution provides also for the purchase or lease of rolling stock and equipment, and provides that 'the G. T. P. Railway Co. and such other company shall be authorized on its part to deal accordingly with the said line of railway or terminal facilities," etc. The Government Railway Act will apply to all lines and facilities leased or acquired under this legislation.

## Building Notes

**Calgary, Alta.**—It is announced that the government will shortly erect a Normal School building here.

**Toronto, Ont.**—The city will spend $70,000 for new buildings at the Canadian National Exhibition.

**Brantford, Ont.**—Brant County Council has decided to secure plans of a new Registry Office to cost $22,000.

**Toronto, Ont.**—A building permit has been granted to A. M. Wagstaff for an addition to a factory at 336 Greenwood avenue, to cost $3,000.

**Toronto, Ont**—The Board of Education has obtained the necessary power to erect an Administration Building on College street. The building will cost $135,000 and will be 60 ft. by 90 ft., 4 storeys high.

**Winnipeg, Man.**—It is announced that the Oldfield, Kirby & Gardner Co., of this city, will erect a modern ten-storey office building. J. D. Atchison & Co., are the architects.

## Miscellaneous

**Canadian Pig Iron in 1914.**—A number of blast furnaces were idle throughout the year. The manufacturers operating furnaces were the Dominion Iron & Steel Co., the Nova Scotia Steel & Coal Co., Algoma Steel Corporation, Steel Co. of Canada, Standard Iron Co., and Canada Iron Furnace Co.

**Ottawa, Ont.**—Fifty-seven rivers in Inland Canada now receive raw sewage from 159 municipalities, while the water supply of 111 places comes from sources above which sewage has been deposited. These facts will be set forth shortly in a report of investigations made by the Commission of Conservation. It will state, however, that conditions are improving, inasmuch as sixty-one sewage treatment plants are now installed in Canada.

## New Incorporations

**New Brunswick Canners Co.** has been incorporated at Ottawa, Ont., with a capital of $10,000 to operate canning factories at St. Andrews, N.B. Incorporators: H. H. McLean, F. R. Taylor and H. F. Puddington, all of St. John, N.B.

**Canadian Wallboard Co.** has been incorporated at Ottawa, Ont., with a capital of $50,000 to manufacture and deal in wood fibres, pulp wood, etc., at Toronto, Ont. Incorporators: H. Riley, W. B. Sturrup and A. Bicknell, all of Toronto, Ont.

**The Premier Electric Co.** has been incorporated at Ottawa, Ont., with a capital of $40,000 to manufacture electrical machinery and supplies of all kinds at Montreal, Que. Incorporators: L. A. David, L. E. A. D'Argy Mailriot and S. H. R. Bush, all of Montreal, Que.

**Bermite Explosives, Ltd.**, has been incorporated at Ottawa, Ont., with a capital of $200,000 to manufacture gunpowders and explosives of all kinds at Montreal, Que. Incorporators: C. W. Berry, of Waterloo, Que.; C. Watt, of Lachine, Que., and F. T. Enright, of Westmount, Que.

**The Guelph Tire & Rubber Co.** has been incorporated at Ottawa, Ont., with a capital of $350,000 to purchase the business and property of the Independent Tire Co. at Guelph, Ont. Incor-

## Catalogues

**Semi-Muffle Furnaces** for case hardening, annealing, carbonizing, heat treating, general hardening and heating work, are described in a bulletin issued by the Gilbert & Barker Mfg. Co., Springfield, Mass.

**Flinn Steam Trap** made by Richard J. Flinn, West Roxbury, Mass. The bulletin describes fully the construction and operation of the Flinn steam trap. The various conditions under which it can be used are given with a reference to its chief characteristics. A sectional view is included, showing the general construction of the trap.

**Saw Sharpening Machines.** Honeywill Bros., London, England, have issued a catalog dealing with an automatic saw sharpening machine, which is fully described and accompanied by a specification. The illustrations show the machine with the necessary attachments for grinding, circular, frame and band saws. A representative list of tooth profiles which can be sharpened on this machine is included among the illustrations. One view shows a machine sharpening a circular saw six feet in diameter.

**A Study of the Malleable Furnace** is the third of a series of booklets which have been issued by the Harbison-Walker Refractories Co., Pittsburgh, Pa. This is a most interesting and instructive volume, containing a fund of information on malleable practice, written in simple language. It aims to present the vital points in as clear and concise a form as possible, so that a fair understanding of the principles involved in connection with the production of malleable iron may be readily acquired by those not familiar with the scientific aspect of such work. The booklet contains six chapters, describing in a comprehensive manner the characteristics and properties of malleable iron and its manufacture. The micro-structure of malleable iron, also air and annealing furnaces are dealt with. The forty-nine illustrations consist principally of a

METAL STAMPINGS
We are manufacturers of stamped parts for other manufacturers.
We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.
We can finish steel stampings in Nickel, Brass or Copper.
Send us a sample order.
W. H. BANFIELD & SONS

**"Metal Welding"**

**NEW TYPE, POSITIVE FEED PRESSURE ACETYLENE**

**Generator**

**Highest standard for strength, durability, workmanship, economy and simplicity of operation.** Made of heavy sheet steel. EVERY SEAM AND EVERY FITTING IS WELDED. It is practically a one-piece generator—no joints or seams to leak, and being galvanized it cannot corrode.

**These machines are absolutely FOOL PROOF,** being equipped with flashback preventers and interferences which make it impossible for any part of the machine to be opened without first venting the machine through the blow-off valve.

CONSTRUCTED IN ACCORDANCE WITH THE RULES AND REGULATIONS OF THE NATIONAL BOARD OF FIRE UNDERWRITERS.

**For full details merely drop a postcard.**

**The Metals Welding Co.**

**CLEVELAND, OHIO**

number of interesting photographs of fractures and photomicrographs. The booklet contains 112 pages and is a high-class production, being printed on coated paper and bound in attractive covers.

**Steam Hammers.**—The Chambersburg Engineering Co., Chambersburg, Pa., has sent us a copy of their new hammer catalogue No. 66, which describes in a comprehensive manner various types of steam hammers, also steam and board drop hammers. A detailed specification is given for each type, and tables are included giving the principal dimensions for each size. The hammers listed have capacities varying from 100 pounds to 20,000 pounds, thus giving a wide range and including types which would be suitable for any work where hammers would be required. A feature of this catalogue is the excellent illustrations, which show clearly the general design of the different types. A number of plates are included showing miscellaneous forgings made under Chambersburg drop hammers. The concluding pages deal with hammer details and their principal features, give directions for operating these hammers, and embrace a complete index of machinery built by the company. The catalogue is printed on coated paper and generally gotten up in an attractive manner.

## Book Reviews

**Sewage Disposal Systems in Canada** is the title of an interesting brochure prepared by T. Aird Murray and T. Lowes, consulting engineers, Toronto. The book describes a number of sewage disposal plants of recent construction and also reviews the development of the septic tank. Various types of sedimentation tanks are also described. The book is fully illustrated and includes a number of photographs, plans and diagrammatic profiles of installations throughout the Dominion. The plants dealt with are all operating and have proved suitable for the climatic conditions.

**Boiler Management and Inspection** by Joseph G. Branch, 62 pages, 7½ in. x 5 in. Published by the Branch Publishing Co., Chicago, Ill. Price 50 cents. This is a new publication dealing in a simple manner with the design, operation and management of steam boilers. The book contains a series of 16 lessons in connection with which are a number of questions for each, bearing on the subject discussed in the lesson. The management, operation and inspection of boilers are dealt with in lessons 1 to 3. Lessons 4 to 8 deal with riveted joints and calculations of stays and braces. Safety valves are described in lessons 9 to 15, while lesson 16 is devoted to the subject of boiler scale and graphite. In addition to the questions already referred to are a series of Civil Service questions and answers. In a book of this description, these questions form a valuable feature, for they not only bring out the chief points in each lesson, but they also help the reader to a clearer understanding of the text. The book is thoroughly practical though more or less elementary in character. The apprentice, student, or even the operating engineer will find in its pages a great deal of extremely useful information, especially with regard to riveted joints and safety valves. The illustrations show a number of riveted joints and various types of these. The book is bound in stiff paper covers with table of contents.

**SHEET METAL STAMPINGS**

# GEARS

## HAMILTON

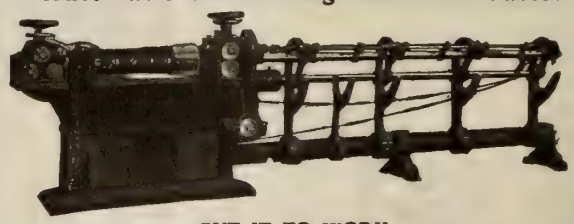
## GEAR & MACHINE CO.

Cor. Concord & Van Horne

TORONTO

High-grade gears are the best value per dollar of first cost.

## Automatic Wire Straightener and Cutter



PUT IT TO WORK

cutting up those coils of wire, and let it earn its cost. Every length will be an exact duplicate of the preceding one, and all will be absolutely straight.

Costs little to run, because it requires little attention beyond placing the coils of wire.

Catalogue gives full information.

**The F. B. SHUSTER COMPANY, New Haven, Conn.**

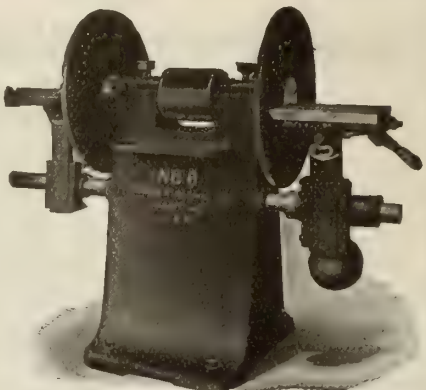
Formerly John Adt & Son. Established 1866

Also makers of Riveting Machines, Sprue Cutters, Foot Presses, etc.

Canadian Agents: A. R. Williams Machinery Co., Toronto.

## Gardner Disc Grinder

Gardner Disc Grinders are made in all sizes, types and combinations. We can successfully meet any disc grinding problem in existence. Largest builders of Disc Grinding machinery in the world.

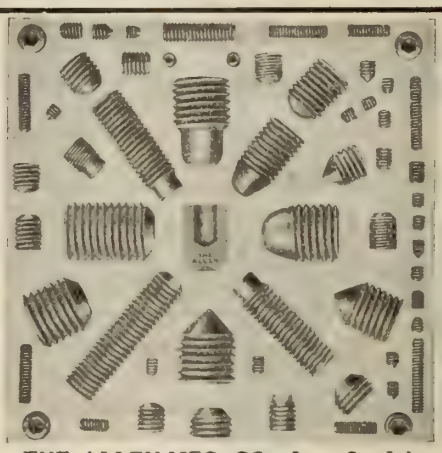


**Gardner Machine Co.**

The Disc Grinding Authorities

BELOIT, WIS.

Canadian Agents: A. R. Williams Machinery Co.



ALLEN Safety Set Screws, any length, point or thread.

**Send for circular No. 3 and free sample screws.**

THE ALLEN MFG. CO., Inc., St. Johns, P.Q., Canada

England: 173 Princess St., Manchester.

## "THISTLE" BRAND RUBBER BELTING

**"Maintenance of Quality"**

is our motto, and our experience in the manufacture of belting since the year 1856 should be invaluable to you. Let us tell you all about this friction faced belting. The price will appeal to you.

Write to-day.

**J. C. McLAREN BELTING CO., LTD.**

TORONTO, MONTREAL, WINNIPEG

# SHAFTING

**Cold Drawn, Turned and Polished Steel, Rounds, Squares, Hexagons and Flats, Steel Piston Rods, Pump Rods.**

Special facilities for Keyseating up to 6 in. diameter.

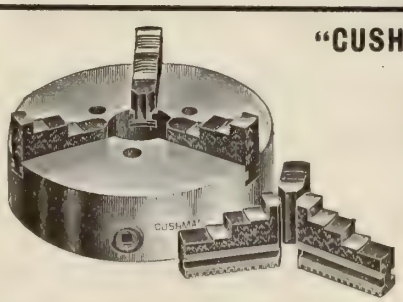
THE

## Canadian Drawn Steel Co.

Limited

Hamilton Canada

## "CUSHMAN" CHUCKS



are generally known as the "heavy pattern," being designed for hard service.

Their accuracy and reliability have been proven over and over again, and the name "Cushman" on your chuck is a guarantee of satisfaction.

Our line consists of many styles and sizes of Lathe Chucks, Drill Chucks, Centering Chucks, and Face-Plate Jaws.

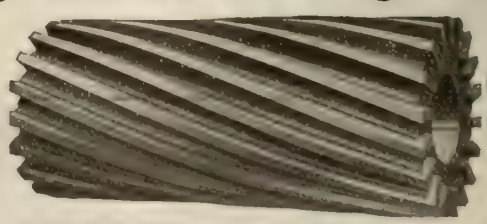
Catalogue Free.

**THE CUSHMAN CHUCK CO.**

Hartford, Established 1862 Conn., U.S.A.

## Taylor-Newbold Milling Cutters

Fast Cutting Powerful



Inserted Helical Blades of High-Speed Steel

With the exclusive features embodied in these cutters alone, stand foremost in fast cutting and economical milling.

Send for Bulletin R. P. and 30-day trial offer.

**. . . . . IS THE SERVICE**

That's what this self-hardening, high-speed steel chaser does for the LANDIS DIE. Four long cutters tangentially disposed to the work carried in suitable holders make an ideal cutting condition. This, along with its many other distinctive characteristics, has established for us a world-wide reputation.

## Particularly Adapted to the Manufacture of Shrapnel

**Your Lathe Needs A NEW TOOL POST, One of the Modern Multiple Type.**

You can no longer afford to use the old style single tool holder.

Give us the size of the dovetail on your lathe carriage and height to lathe center; we will quote you price on a Modern Tool Holder that we guarantee will increase your production, and give you some interesting facts about Lathe Turrets.

No matter what make or size of lathe—we can fit it.

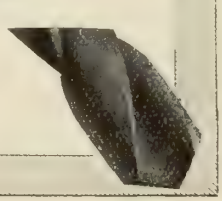
## Fay & Scott, Dexter, Me.

# Cleveland Twist Drills

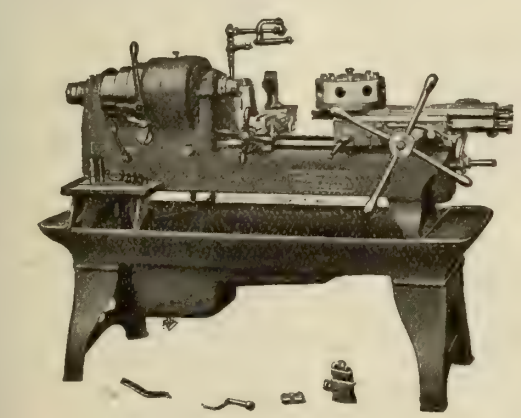
**Big in Value Because of the Holes They Make**

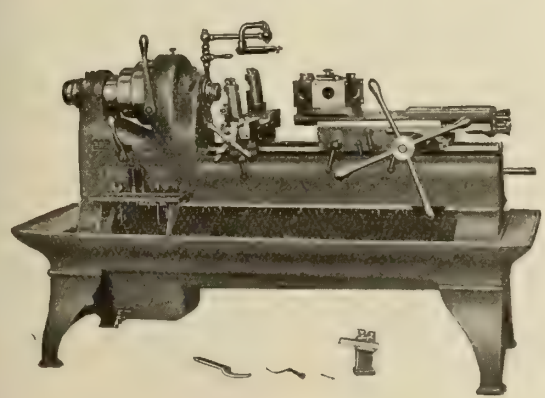
Holes count—not drills. That drill is most valuable that produces the greatest number of holes. Cleveland Twist Drills stand out as Hole makers.

**Be sure and get "Drill Chips" every month.**



**The Cleveland Twist Drill Co.**
New York Cleveland Chicago





# Points You Should Consider For Reducing Chucking Costs

Consider some of these reasons why B. & S. Plain Screw Machines have proved so economical on finishing castings, forgings and pieces cut from the bar. They are worth your attention.

**Head Cast Solid with Bed,** means steadiness under the heavy jobs. 3 point mounting preserves alignments.

**Ample Driving Power** by extra wide belt and powerful friction back gears. 4 speeds available without shifting belt.

**Convenient Operating Levers,** easily understood and quickly operated. No wasted motions because they are in the handiest places.

**Rugged Turret Slide Construction.** Broad bearings for turret and slide with means for easy adjustment. Positive abutment resists end thrust.

**Automatic Turret Clamping,** in addition to positive locking by vertical taper bolt under working tool.

**Powerful Turret Slide Feed** driven by chain and worm gearing. 8 changes for every speed, made without stopping spindle.

**Quickly Adjusted Cross Slide** makes setting up easy. Screw adjustment for tools and stops. Graduated dials provide for accurate forming.

**B. & S. Workmanship**—scraping to full bearings, finest allowances on finish and accurate alignments, resulting in machines of long life.

**Ask us to estimate production on your work.**

# ARE YOU MAKING SHELLS?

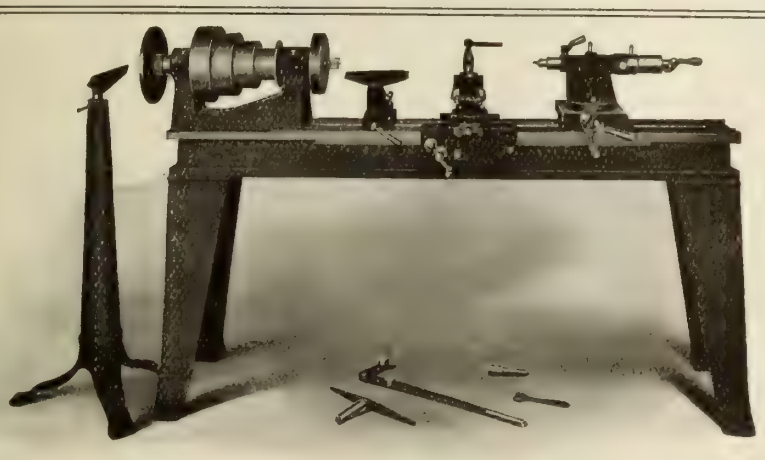
If so, increase the efficiency of your lathes—
reduce your manufacturing cost by using our

# "TYR" BRAND HIGH SPEED STEEL

We recommend it for this particular work.

## ARMSTRONG, WHITWORTH OF CANADA, LIMITED

**Head Office: 22 VICTORIA SQUARE, MONTREAL.** **Works: LONGUEUIL, QUE.**



## Patternmakers' Lathe

**(16 inch Swing, 6 ft. Bed)**

Equipped with a hand carriage having rack and pinion feed in addition to regular hand rest.

The **Spindle** is of high carbon steel and runs in **self-oiling bronze bearings.** Outer end of spindle is threaded for face plate to turn work of a large diameter.

**Tail** stock has graduated swivel base. The base has set-over slide operated by a ball handle, so that same may be fed crossway of the bed, a feature very desirable for boring or turning.

HAS NO EQUAL WHERE EFFICIENCY AND ECONOMY ARE REQUIRED.

May we send full details?

**J. G. BLOUNT COMPANY**
**EVERETT, MASS, U.S.A.**

# A PENNY SAVED IS TEN CENTS EARNED

**A penny EARNED is one cent GROSS profit. But a penny SAVED is ALL NET. That's why it pays to save.**

For a source of unusual savings, look into the question of Files. See if your men are using **inefficient** files. Working with worn files that have ceased to do good work.

Every such file you find in service may mean many dollars lost. For beyond a certain point, a file's best efficiency is gone. It then requires so much time to perform a given task, that it's real ECONOMY to throw it away. To replace it with a new file—at once. What you thus save in time and labor would pay for many new files of the "Famous Five":

## KEARNEY & FOOT
## GREAT WESTERN
## AMERICAN
## ARCADE
## GLOBE

***(Made in Canada)***

They reflect the facilities of 5 great plants. The precision of costly automatic machinery. The economy of a 60,000,000 yearly output. The uniformity of complete control in every process. The perfection of rigid inspections and practical tests. The wide range of 4,000 different patterns. The unvarying high quality that won—and now holds 90% of Canada's file trade.

The "Famous Five" will save money in your shop if you give them a single trial. They pay their way many times over in better work at lower cost.

*"File Filosophy" and our Catalog should be on your desk. Write for THEM to-day.*

## U. S. Electric Drills and Grinders

**Save Time, Labor and Money**

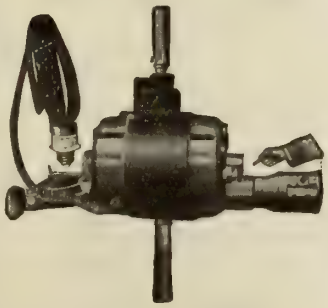
They can be attached to any lamp socket.

For drilling in metal they are superior to any other kind of portable drill. Cost 50% less to run than air drills.

**3 SIZES.**
**3-16 inch, W.G.T., 6 lbs.**
**¼ inch, W.G.T. 9 lbs.**
**⅜ inch, W.G.T. 12 lbs.**

All motors wound for 110 or 220 volts. Direct or alternating current.

Try a few of our Electric Drills and Grinders and you'll send us an order for more. Our guarantee protects you.



**⅛ inch—2 SPEED.**
**Speed, 400-750 R.P.M.**

**For Sale By**

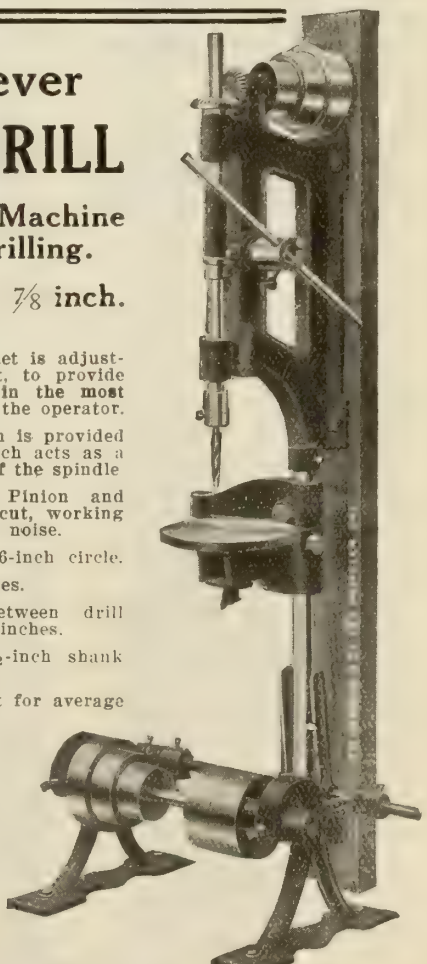
**Montreal, St. John, N.B., Toronto, Winnipeg, Calgary, Vancouver.**

**THE UNITED STATES ELECTRICAL TOOL CO.**
CINCINNATI, OHIO

## 16 in. Lever POST DRILL

**A Giant Little Machine For Light Drilling.**

**Will drill up to 7/8 inch.**



The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16-inch circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½-inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

WHEN you need new equipment or supplies for your machine shop

**Consult this Directory**

¶ You'll find listed here the reliable makers of the lines you need; firms who believe in the progressiveness of present-day manufacturers and who appeal to their intelligence through their own engineering journal.

¶ Consult Canadian Machinery Buyers' Directory and you can't go wrong in your buying.

# No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.
Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.
*How to use Stevens' Stopper, or Circle Cement:*
Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.
Another thing—I do not ask a fancy price for it.
A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

## Sets a new high-mark for efficiency and economy

Main Spindle has taper journals which run in annular bearings.

Constant lubrication is assured by ring oilers which revolve with spindle and pump oil from reservoirs underneath bearings.

Thrust is taken on front bearing, and journals have independent adjustment in either bearing.

Feed Shaft is driven from spindle by heavy silent chain pro tected with complete guard, supplied with compression grease cup for lubricating chain and sprockets.

All Feeds positive driven through gearing, giving 18 changes.

Automatic Feeds can be operated simultaneously and reversed while machine is in motion.

Feed Gearing is Hardened and feeds have independent controls.

Vertical and Cross Feed Hand Wheels have concealed clutches in hubs which allow wheels to run free on shaft when not employed.

Dividing Head is cylindrical in pattern. Supporting Block for Spindle is carried by side plates which recess into block and have annular bearings in ring of main frame.

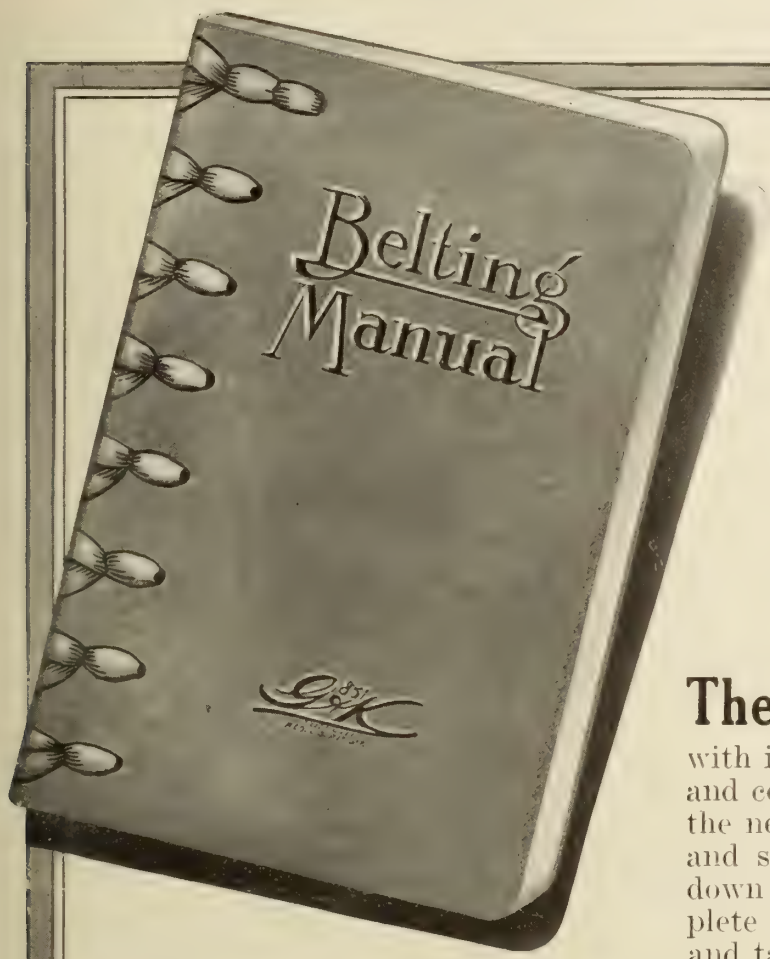
# CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng

Vol. XIII | Publication Office: Toronto, April 15, 1915 | No. 15



## The "Belting Manual"

**is the "how" book on belting transmission, it tells:**

—how to select belts.
—how to install, lace and care for belts.
—how to make belts endless on the pulleys.
—how to find the width, speed and horse-power of belts.
—scores of other "hows" which are constantly coming up in your Power Transmission problems.

## The "Belting Manual"

with its 96 pages is the most thorough and concise book of its kind, giving all the needed information in the shortest and simplest fashion. It gets right down to bed-rock and is unusually complete with authentic mechanical rules and tables.

We want every belting user to have a copy of the "Belting Manual." If you haven't one send the coupon or use your letterhead, and the book will be sent you by return mail.

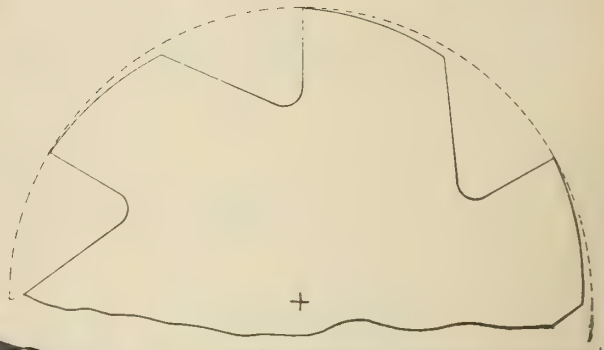
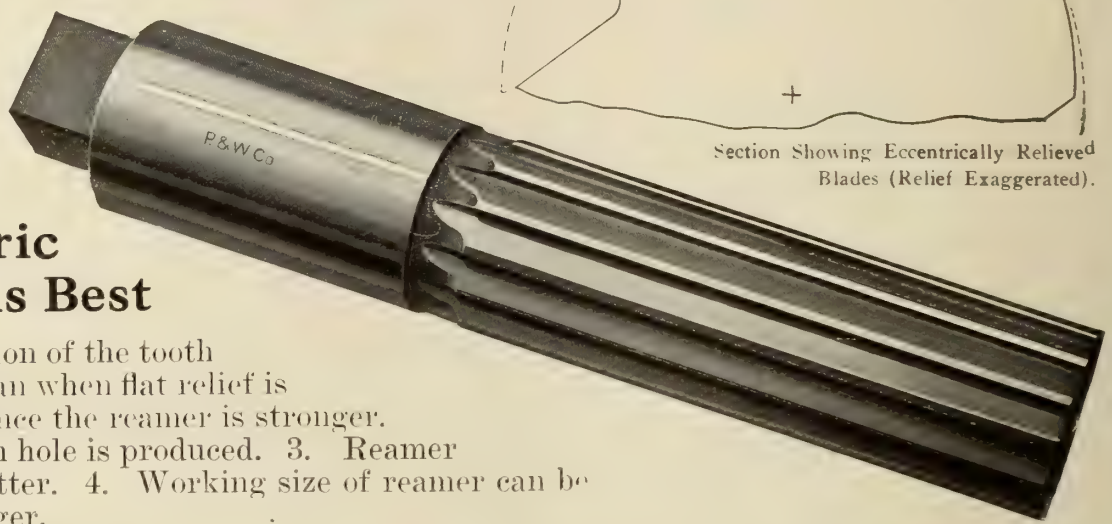
# ECCENTRIC RELIEF

## Exclusive Feature of All Pratt & Whitney Reamers



Section Showing Eccentrically Relieved Blades (Relief Exaggerated).



## Why Eccentric Relief is Best

1. The section of the tooth is greater than when flat relief is used, and hence the reamer is stronger. 2. A smooth hole is produced. 3. Reamer does not chatter. 4. Working size of reamer can be retained longer.

TRADE COMMISSIONER SERVICE

February 11, 1915.

The MacLean Publishing Co., Limited,

Toronto,

Canada.

Gentlemen:

I beg to acknowledge, with many thanks, receipt of the Dec. 31, 1914 copy of Canadian Machinery and Manufacturing News - - Annual Review and Directory Number.

I am greatly pleased over receiving this book, as I am much interested in trying to introduce Canadian machinery into China. I shall place the Number which I have in the hands of the largest machinery agents in Shanghai in the meantime, and if you could kindly send two or three more I shall also place those in suitable hands.

It seems to be such an excellent number that I am in hopes that its presence on files in the offices of several of the leading machinery dealers in China may rouse their interest in Canadian manufactures.

I have the honour to be,
Sirs,
Your obedient servant,

J. W. Ross

JWR/V. Canadian Trade Commissioner.

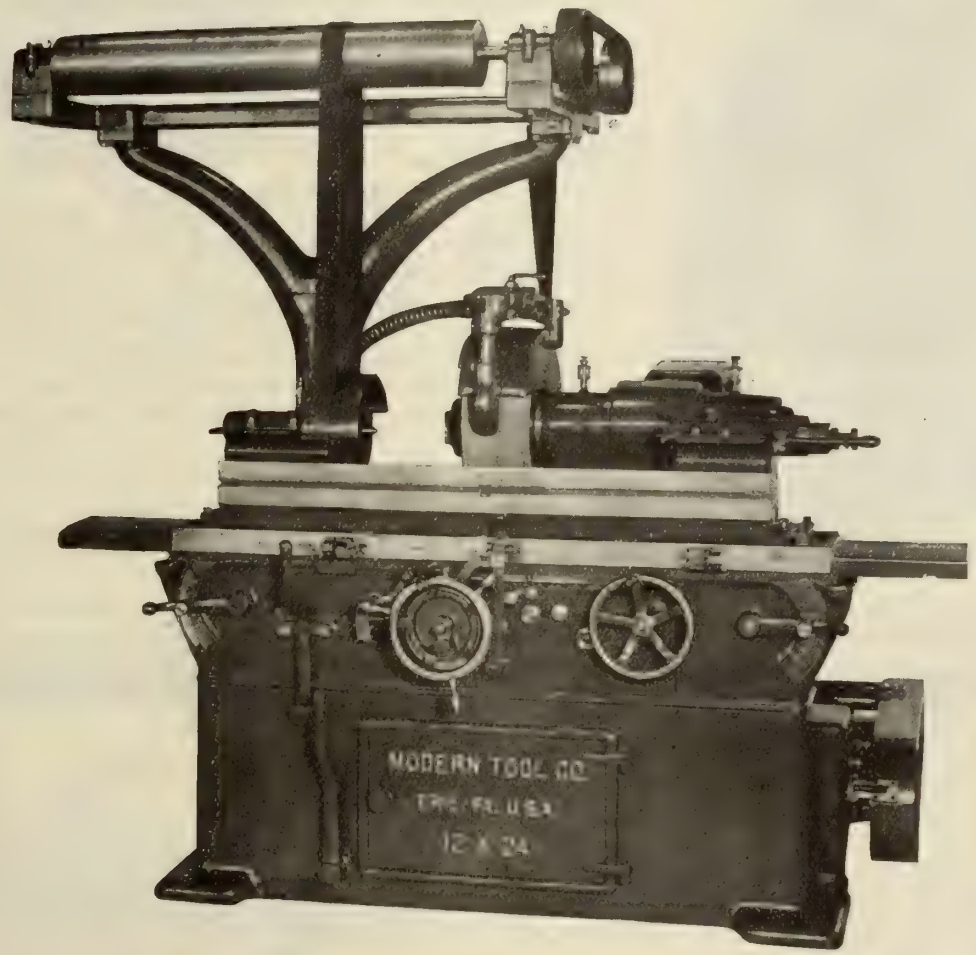
WE know of at least one Canadian manufacturer who has already received inquiries from two of the most important Machinery Merchants in China as a result of advertising in our Annual Review Number. Doubtless there are others who have received similar inquiries. If so, we shall be glad to hear from them.

Some of these times Canada will rank as one of the world's greatest manufacturing nations.

# Finishing Shrapnel Shells

ON THE

## "MODERN" 12" x 24" Self-Contained Grinding Machine



## The heaviest, most powerful and efficient Standard Grinding Machine made for Shell work

The "MODERN" 12" x 24" Grinding Machine is especially adapted for grinding Shrapnel Shells. The Machine is more than guaranteed, it is demonstrated. Large diameter, wide face wheel, with powerful drive—automatic feed without traversing the table—absolute central control of all levers and hand wheels—single constant speed drive.

We have recently sold a large number of these Machines in Canada, completely equipped for Shrapnel Work. Ask the man who is using the "MODERN."

The large manufacturer appreciates the production possible on this Machine. Machine comes equipped for all classes of straight and taper cylindrical work.

SEND FOR BLUE PRINTS AND ESTIMATES.

# Turning Losses Into Profits

John Doe is a good mechanic. But he used his files too long. Stock-room records showed *low* file-consumption. Labor-cost ran *high* on every job. *Pennies saved* in the stock-room—*dollars lost* in the shop.

Investigation!

John Doe ordered to discard worn files promptly. To stop using inefficient files. Stock-room bought more files. John Doe did more work. In less time. At lower cost. *Pennies invested* in the stock-room—*dollars saved* in the shop.

That—in a nut-shell—is the story of *efficient* filing.

When John Doe saves files — *you lose money.* When he discards worn files promptly —*you make money.* And you make the most net profit when John Doe uses only the "Famous Five":

**KEARNEY & FOOT**
**GREAT WESTERN**
**AMERICAN**
**ARCADE**
**GLOBE**

***(Made in Canada)***

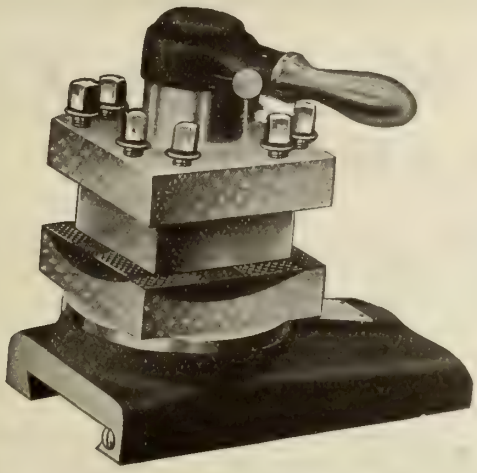
**Accurately manufactured in 60,000,000 quantities—in 4,000 different patterns—used by 90% of Canada's file-users—the "Famous Five" cut costs.**

A trial in **YOUR** shop **PROVES** this!

*"File Filosophy" and our Catalog sent FREE on request.*

## NICHOLSON FILE COMPANY

**PORT HOPE, ONTARIO**



## Particularly Adapted to the Manufacture of Shrapnel

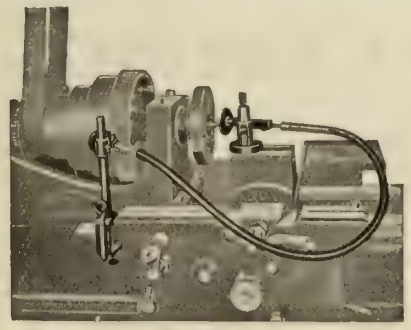
**Your Lathe Needs A NEW TOOL POST. One of the Modern Multiple Type.**

You can no longer afford to use the old style single tool holder.

Give us the size of the dovetail on your lathe carriage and height to lathe center; we will quote you price on a Modern Tool Holder that we guarantee will increase your production, and give you some interesting facts about Lathe Turrets.

No matter what make or size of lathe—we can fit it.

## Fay & Scott, Dexter, Me.



# CENTER GRINDER

**(Improved)**

## CHEAP! PRACTICAL! DURABLE!

The most popular tool of its kind on the market. Adjusted in a moment.

An occasional use will keep your Lathe centers in perfect order.

## Stow Mfg. Co.

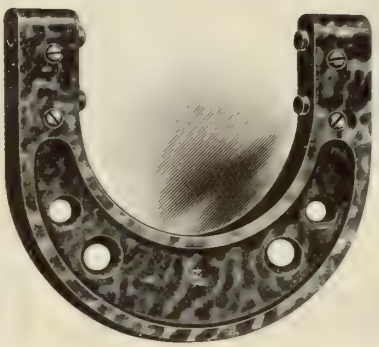
**Binghamton, N.Y., U.S.A.**

**Chicago Office, 106 So. Jefferson St.**

*Little Giant*

# Cylindrical Limit Gages

## For Shells and Shrapnel



## Crescent Gage

This gage is peculiarly adapted to the accurate measuring of outside diameters of Shells and Shrapnel as well as other cylindrical work.

The upper points are set to the maximum limit—the lower points to the minimum limit. These can be sealed to prevent tampering.

## One gage does the work of two

with all the consequent saving of time and labor.

Points are of tool steel, hardened and ground.

**We are also prepared to quote prices on special gages for Shell Work. Write us about your requirements.**

## How Much Use Do You Make of Expert Demonstrators?

Many a manufacturer could get better production if he would utilize the expert knowledge and broad experience of the demonstrators of

## Norton Grinding Wheels

A large producer of malleable castings made an interesting test with his own workmen at the suggestion of a Norton salesman. He was using Norton Alundum Grinding Wheels and was well satisfied. But grinding wheels are being made more efficient every year and our stock of knowledge of how to increase the production in grinding operations is steadily growing.

The method of test was this:

One stock wheel and one trial wheel were put on the same spindle of a floor stand so that both ran at the same speed. The two men working on these wheels ground castings from the same pile and changed daily from one wheel to the other. Below is shown the comparative results:

| | Stock Alundum Wheel | Trial Alundum Wheel |
|---|---|---|
| Lbs. ground per hour | 309 | 315 |
| Average cost of wheel per ton of castings ground | $0.45 | $0.352 |
| Average of wheel wear per ton of castings ground | 34.98 cu. in. | 27.40 cu. in. |

This gain in production and decrease in wheel cost was the result of a more intensive study of the operation and the selection of a wheel better suited to the job. It needs only a word from you to secure from us the same kind of co-operation.

# Prompt Delivery

Now, more than at any time in the past, firms who are looking for machinery, appreciate the prompt delivery which we can make.

Among the machinery which we have in stock for immediate shipment are the following lathes:

1 Seneca Falls Engine Lathe, SBG & QCG.
1 16″ x 10′ McDougall Engine Lathe, SBG.
1 18″ x 8′ Springfield Engine Lathe, DBG.
1 18″ x 10′ McDougall Engine Lathe, SBG.
1 18″ x 10′ McDougall Engine Lathe, DBG & QCG.
1 20″ x 12′ McDougall Engine Lathe, SBG.
3 22″ x 10′ McDougall Engine Lathes, DBG & QCG.
1 22″ x 14′ McDougall Engine Lathe, SBG.
2 26″ x 12′ McDougall Engine Lathes, DBG & QCG.
5 26″ x 16′ Bridgeford Engine Lathes, DBG.
2 18″-30″ x 10′ McDougall Combined Engine & Gap Lathes, DBG.
1 18″-30″ x 12′ McDougall Combined Engine & Gap Lathe, DBG.
2 20″-36″ x 12′ McDougall Combined Engine & Gap Lathes, DBG.
1 20″-36″ x 16′ McDougall Combined Engine & Gap Lathe, DBG.
1 22″-40″ x 14′ McDougall Combined Engine & Gap Lathe, DBG.

# Concerning the Selection of Suitable Gear Pitches

By John Edgar

*Most of the manufacturers of gears possess a large number of mechanical text books and furnish a uniform set of rules and formulae for the proportions of the standard involute system of toothed gearing. These all, however, have their limitations, and have been trespassed by the demands of modern gear drives. Overcoming the difficulties is dealt with here.*

DESIGNERS are now giving the gear question more study, and one point they can look into with profit is the interference of the teeth with one another. The automobile may be thanked for bringing this subject along with many others into prominence. The gearing of the automobile, next to

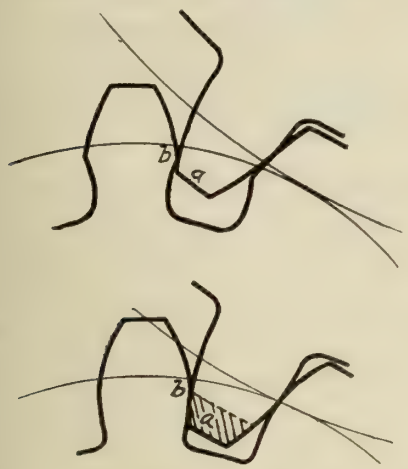

FIG. 1. INTERFERENCE OF TEETH OF GEAR WITH FLANK OF PINION AND ITS CORRECTION.

the motor has received more thought than any other feature of its design. The limited space allotted the transmission necessitates the use of very small gears in proportion to the service they are called on to give. This calls for coarse pitches and gears of small number of teeth. In fact, the diameter is, in all cases, the minimum and in many less than the minimum diameter for the recognized standards of interchangeable gearing. To avoid interference as much as possible the newer stub tooth standard was brought into use. This system, with its short addendum and twenty-degree pressure angle, has reduced the interference to a minimum for any of the recognized standards.

Geared drives are becoming numerous in the machine tool field and in this use also, compactness and smooth running are essential, both of which tend to make the design of the teeth of primary importance. The range of speed ratios required by this line is much greater than in the automobile, and the gears are more numerous. The special grades of steel developed for the automobile are adaptable to the machine tool as well. Noise in the olden days was considered one of the accompaniments of the tooth gear, and was not heeded. All this is changed for, at the present time, in the construction of high grade cars, gears that utter the faintest murmur are rejected. The gear that has been produced under proper conditions will run quietly if the tooth curves are correct and the number of teeth chosen to avoid interference.

### Interference.

Interference, is the common fault of noisy gears. Unless avoided, the greatest care in the forming of the tooth curve will be of little avail. There is a well defined law in odontics that must be obeyed in order that the teeth clear one another and roll together with a uniform motion. It should be the aim of the designer to obey this rule, and he can do so by a careful study of the subject. The reason why designers have not given the subject particular attention along practical lines is the fact that the tooth curves have all been made to a system that has long been accepted as the standard and from which it has been hard to deviate. The automobile, however, has revolutionized this and we now are in the way of having a standard adopted that will give better results in a wider field than the old system was capable of. The modern systems of generating the teeth of the gears leaves the problem open for more independent rsearch in this field than when we were confined to the older formed cutter methods. Many designers of machinery, dependent on gears to a large extent, have a very hazy idea of the theory or practice of tooth gearing beyond the mere knowledge of the rules for finding the diameters.

The manufacturer of gear cutters has taken care of the interference of the teeth in the best manner possible for him. Besides limiting the range of the number of teeth to be cut with a single cutter, he has corrected the curves to the extent necessary to avoid interference as much as possible. The range of the standard set of cutters is from 12 teeth to the rack. That the interfer-

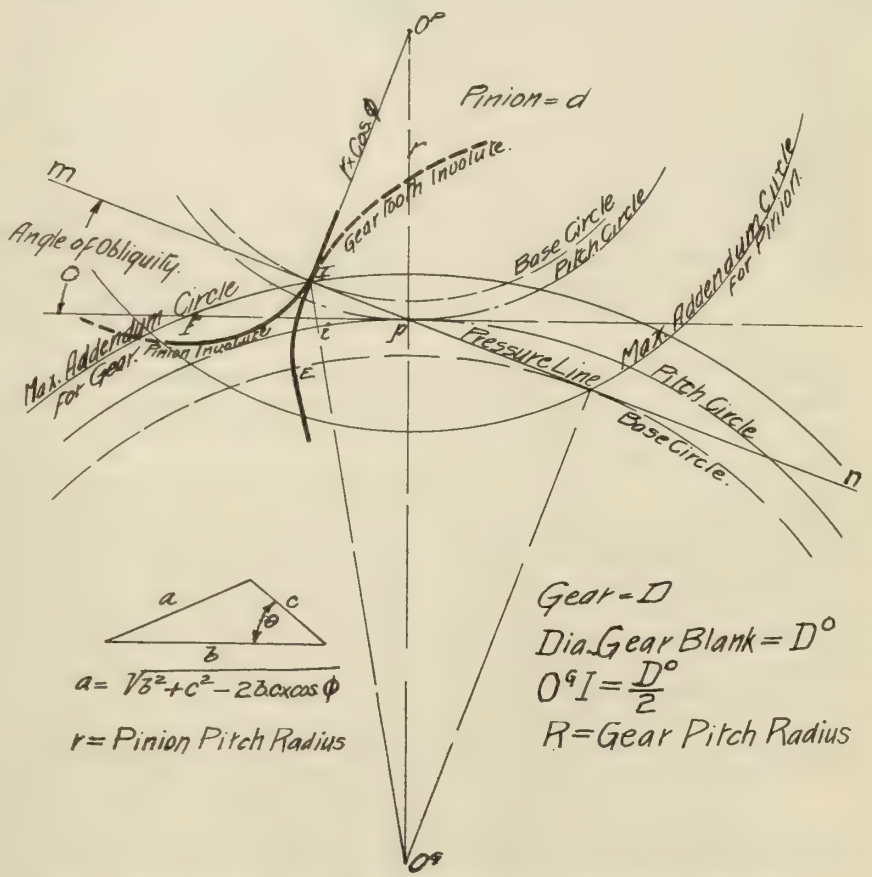

FIG. 2. FUNDAMENTALS IN THE PRODUCTION OF TOOTH CURVES.

ence is between the point of the tooth of one gear and he flank of the tooth of the mating gear is generally known, and 30 teeth is commonly accepted as the smallest number of teeth for a gear in which interference is to be avoided. This is truly the case when we have the higher number of teeth meshing with the 30-tooth gear, such as the rack, and the interference is gradually decreased until it disappears when we reach the lower numbers of teeth. It is the object of the writer to show how by a proper selection of pitch, gears may be proportioned for any given ratio to avoid interference.

The interference of the teeth of two gears in mesh is illustrated in Fig. 1. The point of the tooth (a) is seen to be hooking into the flank of the mating gear near the base line at (b). The result of this hooking action is the rapid wearing of the teeth at these points, and the weakening of the teeth very near the root. This interference may be so bad as to spring the tooth under heavy loads. The intermittent straining has a tendency to crystalize the metal and eventually the tooth will break out. It obviously requires extra power to cause the tooth to ride over this point of interference which, though a small item in a single pair of gears, is worth considering in a system of several trains, even should the wear not be taken into account.

FIG. 3. GEAR CHART FOR DETERMINING PITCH, CENTER DISTANCE AND ADDENDUM; RATIO OF GEAR TO PINION BEING KNOWN.

**Removing Cause of Interference.**

It is quite evident that this interference can be avoided by removing the part of the tooth (a) that projects above the point of interference. This is commonly accomplished to a certain degree by pointing the tooth from the point (a) out. This altering of the curve causes a back lash between the teeth and will result in hammering and squealing. If the pair of gears were to be designed with reference to the avoidance of the interference, and the pressure angle were to remain the same, the diameter of the blank would be reduced so that the tooth would not extend beyond the point (a) Fig. 1. If it were desired to use standard cutters, the pitch would have to be chosen accordingly.

In order that the following matter may be more easily grasped, we will refer to the diagram Fig. 2. This is to show as simply as possible, the method of arriving at the construction of the fundamentals of a pair of gears. The centres of the pinion and gear are designated by $O^p$ and $O^q$ respectively, the pitch circles of each being tangent at the pitch point (p). The base circles of the gear and pinion are drawn tangent to the pressure line, which crosses the pitch point at an angle O. The angle of obliquity O, being that for the involute system chosen. From the centres of the gear and pinion respectively, and perpendicular to the line of pressure (mn), also intersecting the base circles at the point of tangency, a line is drawn in each case. The points of intersection of these perpendiculars with the base circles are the **interference points.** At this point (I) for the pinion, the teeth of the gear cease to roll on the teeth of the pinion, but commence to hook into the flanks of the pinion teeth. The position of this point limits the diameter of the gear, and the distance $O^g$. I. is the limiting radius of a gear blank, or addendum diameter that will mesh with this pinion without interference. From this point out the curves of the teeth of the pinion cross those of the gear, and if the diameter is not reduced, the tooth curve must be changed from the involute.

The same construction applies in the case of the pinion as for the gear, and it will be seen that the limiting addendum circle is much larger in proportion for the pinion, than for the gear. From this it is seen that, if the gear be made so that it will not interfere when the standard addendum of $\frac{1}{P}$ is used, the teeth of the pinion will not interfere with the flanks of the gear.

**Dimensions of Blanks.**

The problem becomes simply that of finding the diameter of the addendum circle that intersects the interference point I, the radius of which is $\frac{D^o}{2}$, Fig. 2. We know the distance between centres of gear and pinion which we call (c) and the ratio of gear to pinion $\frac{D}{d}$, from which we can find that the pitch radius of the pinion $r, = \frac{c}{1-R}$ where R is the pitch radius of the gear. The radius of the maximum addendum circle of the pinion $O^pI$, is $r \times \cos O$. The problem now resolves itself into solving the obtuse angled triangle $O^p O^g I$ to find $O^gI$ and $O^pI$ which may be done by the formula,

$a = \sqrt{(b^2+c^2-2bc \cos O)}$. See diagram.

Fig. 2.—Inserting values, we get

$$D^o = \sqrt{c^2 + \left(\frac{c \cos O}{1-R}\right)^2 - 2c\left(\frac{c \cos O^2}{1-R}\right)}$$

$$= 2\sqrt{c^2 + \left(\frac{c \cos O}{1-R}\right)^2 - 2\left(\frac{c^2 \cos^2 O}{1-R}\right)}$$

$D^o$ is the outside diameter of the blank and D is the pitch diameter, so that the addendum is $\frac{D^o-D}{2}$. The diameter pitch P is the reciprocal of the addendum and is therefore $P = \frac{2}{D^o-D}$ which becomes after substituting the value of $D^o$,

$$P = \frac{2}{\left[2\sqrt{c^2 + \left(\frac{c \cos O}{1-R}\right)^2 - 2\left(\frac{c^2 \cos^2 O}{1-R}\right)}\right] - D}$$

There are two systems of involute gearing, one with the angle of obliquity

at 14½° and the other having it equal to 20°. Inserting the values of cos $\theta$ in the above formula we get, for the 14½° system,

$$P = \frac{2}{2\sqrt{\left[c^2 + \left(.968\ \frac{c}{1-R}\right)^2 - \left(1.878\ \frac{c^2}{1-R}\right)\right]}}$$

and for the 20° system,

$$P = \frac{2}{2\sqrt{\left[c^2 - \left(.94\ \frac{c}{1-R}\right)^2 - \left(1.766\ \frac{c^2}{1-R}\right)\right]}}$$

**Plotting the Curves.**

By taking the centre distance (c) as equal to 1, we can calculate a series of values of P for various values of R and, from the results plot a curve. This has been done in Fig. 3 for both the 14½° and 26° systems for values of R ranging from 1 to 10. By dividing the resulting values of P, for any ratio, as obtained from the chart by the centre distance in inches we get the maximum diametral pitch possible with that ratio without interference.

The relative positions of the curves on the chart explain why there are so many that advocate the 20° system in place of the 14½° system of tooth curves. The 20° involute affords a greater range of ratios without interference than the 14¼° involute, so commonly used.

The 20° curve in the chart is applicable to the "Fellows stub tooth system" also, by using the addendum pitch number of the combination as the pitch chosen from the chart and then spacing the teeth with the spacing pitch number, as follows; ratio 4 to 1 at 5" centres, entering the chart at the horizontal ordinate corresponding to the ratio, and following it to the intersection with the 20° line and read the vertical ordinate, 38, which divided by the centre distance gives the maximum diametral pitch which is 7.6P or 8P as the next smaller whole pitch should be used. In the Fellows system the larger number represents the addendum number so we would choose, in this instance, the 6-8 pitch. The sum of the diameters of the two gears is 1 + 4 = 5" and the number of teeth in the two gears would be $\frac{4}{5} \times 5 = 30$. The gear having — of 30 or 24, and the pinion, 6 teeth. This is evidently an impractical combination.

If the gears in the above example were made to the standard addendum, the pinion and gear would then have 8 and 40 teeth respectively. The pinion has too few teeth to be practical with the standard addendum, it being too short to give continuous motion and could not be produced by standard cutters or hobs. Twelve teeth is the accepted minimum in practice although, in special cases, the number can be reduced to 10 or even 9 teeth if the motion is not to be of a positive character. When the number of teeth in the pinion is below the minimum the only recourse is to increase the centre distance or to reduce the pitch of the teeth. If the former is decided upon, the method is as follows; the pinion must have at least 12 teeth and, as the centre distance is in the inverse ratio to the pitch number, we would get for our corrected distance, $\frac{12}{8} \times 5 = 7.5$ in. The pitch would still be 8.

As another example, take the same ratio and centre distance but the 14½ degree system: The chart gives 74 as the pitch for one inch centered distance which, divided by the centre distance 5, gives the maximum pitch as 14.8, or say 15. The number of teeth in the pinion figures out to 18.75 teeth. This pitch may be too fine and it may not be convenient to increase the centre distance in order to increase the pitch. We may, however, increase the pitch by reducing the number of teeth in the pinion, but this again, will cause an interference between the teeth. To avoid this interference we may make the diameter of the gear blank equal to the outside diameter of a gear of the pitch obtained from the chart and cut the teeth of a coarser pitch making them shallower by one-half the reduction in diameter, providing we do not make the pitch such that the distance i.p. Fig. 2, is not less than the circular pitch of the tooth. If it were, the action would not be continuous as one pair of teeth would go out of action before the next engaged. It would not be necessary to make any change from standard in the diameter of the pinion the diameter being calculated from the selected pitch.

On the other hand, if we have a ratio to satisfy and wish to use gears of a certain pitch, we work as follows: The rule on the chart is divide the pitch for one inch centre distance as found for the ratio by the diametral pitch, it is desired to use, and the quotient is the centre distance in inches. Thus for example, if we have a ratio of 4 to 1 to satisfy and wish to use gears of 4-pitch (14½ deg.) the centre distance will be 74 ÷ 4 = 18.5 inches. If we wish to avoid interference between the meshing teeth, the pinion would have $20 \times 4 \div (1 + R) = (2 \times 18.5 \times 4) \div (1 + 4) = 29.6$ teeth, c being the centre distance and R the ratio.

As has been stated in the foregoing part of the article, the curve of standard gear cutters has been corrected to avoid the interference but even then the teeth of the gears that are within the prohibited range will bear harder on one another than they should and to get the best results, the combinations should be designed according to the chart with numbers of teeth that will insure the avoidance of interference. The gears will run smoother, can be meshed with less back lash, and will wear longer and require less power to run.

**Comparison of Systems.**

The days when noisy gears will be tolerated is past now that it is generally known that quiet gears are a practical possibility. The general user of machinery is now so well acquainted with the automobile that he wants as high grade workmanship in every piece of machinery he puts his money into, knowing that the longer life and lower upkeep will compensate for any reasonable increase in the first cost. The power consuming and destructive qualities formerly attributed to gears has long been shelved by those who pretend to be up-to-date.

The question of tooth interference must not be lightly treated if we are to have the success that we expect with the gear train because this interference is not only a hindrance to quiet running but imposes a destructive wear on the teeth themselves: The vibrations set up by the intermittent hammering of the interfering teeth is not only destructive to the tooth surface, but is transmitted to the other components of the mechanisms and has a tendency to disintegrate and loosen fastenings. This vibration also has a tendency to disrupt the film of oil in all the bearings making it difficult to maintain a proper lubrication of the whole system.

When it is impossible to comply with the requirements of the charted quantities, and the case warrants the expense, the interference may be conveniently avoided by a change in the pressure angle of the teeth, or by altering the addendum as already pointed out. This change in the addendum has been taken advantage of in the design of some bevel gear drives for automobiles. In fact we may say that it is now the universal way of making these gears, the addendum being very much reduced below the normal in the case of the gears and increased in the case of the pinions to make the whole depth the same as the present standard, although there seems to be no particular reason for doing this. The more logical way to do would be to make the depth special to suit each particular case.

We shall, no doubt, continue to have those noisy gear drives with us but in the finer mechanisms, the care and time necessary to obtain noiseless gears is

well spent. It is better to avoid incorrect combinations than to make corrections and alterations in order to make the wrong combination pass. If, in mechanisms, it is found that the high ratio desired cannot be obtained with but one train of gears the reduction is much better made with two or more trains than to make one train that will not make a quiet running combination.

## RAILROAD ENGINE HOUSES.

THE American Railroad Engineering Association, through its Committee on Buildings, has issued the following report relative to engine-house design and equipment features:—

### Form.

(a)—The circular form is preferable.

(b)—At points where not more than three or four locomotives are housed at one time, and where it is more economical to provide a Y track than a turntable, or where it is not necessary to turn locomotives, a rectangular house, either with through tracks or with switches at one end only, may be desirable.

(c)—At shops where a transfer table is used, a rectangular engine house served by the transfer table may be desirable.

### Turntable.

(a)—The turntable should be long enough to balance the engine when the tender is empty.

(b)—A deck turntable is preferable to a through table.

(c)—At important terminals, turntables are most economically operated by mechanical means. Where few and light engines are turned, hand operation may be desirable.

Where electric power can be obtained at a reasonable cost, an electric tractor is the most efficient means for operating a turntable, the cost of power is cheaper, and it is superior in continuity of service and maintenance. The first cost is approximately the same as an air motor of equal power and size.

Power wires are brought to table by either the overhead or the underground method. An overhead device has the advantage of accessibility for inspection and repair. Special care must be taken to properly protect collector head from weather and gases and support collector rigidly (framework supporting same should be fastened to steel frame of table and not to ties, and must be securely braced). The wires should be large enough to keep them from breaking from sleet and should be supported to framework supporting collector. Any play at table multiplies at collector head. Wires should be brought to pole, close to curb of turntable, keeping lines as far distant from nearest wall of roundhouse as possible, to minimize the danger of destruction by fire.

When the underground system is properly installed, its advantages are that all exposed non-current carrying parts are permanently grounded, including the circular-track rail (the only part of system to repair is collector head); non-interference from weather if turntable pit is properly drained.

The disadvantages are: The wire is not so easily repaired, and is much more difficult to originally install, as it must be properly protected from water, and cannot be successfully laid in a fill or on ground where settlement or shifting takes place. Where turntable pit cannot be well drained, it cannot be used with success. It has the advantage of protecting power to run table in case of fire to roundhouse, especially in one of a nearly complete circle.

Compressed air tractors are frequently used. Ordinarily the power costs much more than electricity and is not so reliable. At points having no power plant the locomotive to be turned furnishes the compressed air; in this case an auxiliary supply should be maintained by providing a small air tank, secured to the turntable for operating it before or after the engine is placed.

(d)—The deck on turntable should be wide enough to provide a walk on each side and be protected with hand rails.

### Turntable Pit.

(a)—The turntable pit should be well drained and preferably paved.

(b)—The circle wall should be of concrete or brick, with a wood coping not less than 6 ins. thick.

(c)—The circle rail should preferably bear directly on concrete base. The use of wood ties and tie plates supported by masonry is desirable under some conditions.

(d)—Easy access to the interior of a turntable for the oiling of bearings, painting and inspection should be provided in the design of the turntable pit, unless ample provision is made in the turntable itself.

### Door Openings.

The clear opening of entrance doors should not be less than 13 ft. in width and 16 ft. in height.

### Doors.

Doors should be easily operated, fit snugly, be easily repaired and maintained, and should admit of the use of small doors.

### Tracks.

(a)—Lead tracks to the turntable should line up with tracks of the engine house where possible.

(b)—Tracks should be on a level grade and should be provided with stop blocks.

(c)—Special fastenings of the track rails at the circle wall and on the turntable are desirable to prevent movement of the rails, to give good bearing, and to lessen the damage from derailed wheels.

### Position of Locomotive.

In a circular house, the locomotive should stand normally with the tender toward the turntable.

### Length of House.

The length of stall along centre line of track should be at least 15 ft. greater than the overall length of the locomotive, to provide a walk-way behind the tender, a trucking space in front of the pilot and a certain distance in which to stop the locomotive or to move it to bring side rods or other parts into convenient positions.

### Materials.

(a)—The material used in construction of the house should be non-corrosive, unless proper care be taken to prevent corrosion.

(b)—The additional security against interruption to traffic from fire warrants serious consideration of the use of a fireproof roof, and dividing the engine house into units of approximately ten stalls by the use of division walls built of fireproof material.

(c)—When the roof is of reinforced concrete the columns and roof beams should be of the same material.

(d)—Reinforced concrete should be used for the walls only where special conditions reduce its cost below that of brick or plain concrete, and should not be used for that portion of the wall directly in line of track where engine is liable to run into it.

### Engine Pits.

Engine pits should be not less than 60 ft. in length, with convex floor, with drainage toward the turntable. The walls and floors may be of concrete. Proper provision should be made for the support of the jacking timbers.

### Smoke Jacks.

The smoke jacks should be fixed. The bottom opening should not be less than 42 ins. wide and long enough to receive the smoke from the stack at its limiting positions, due to the adjustment of the driving wheels to bring the side rods in proper position for repairs. The bottom of the jack should be as low as the engines will allow, and it should be furnished with a drip trough. The slope upward should be gradual to the flue. The area of the cross-section of the flue should not be less than 7 sq. ft., and the jack should be made of non-combustible material. (This design of jack applies to all houses where regulations will per-

mit. In some cities, where smoke abatement laws are in force, special design of jacks are necessary.

**Floors.**

The floor should be of permanent construction, and should be crowned between pits.

**Drop Pits.**

Drop pits should be provided for handling truck, driving and trailer wheels.

**Heating.**

(a)—Heat should be concentrated at the pits. The outlets should be fitted with dampers, so that heat can be cut off while men are working in the pit.

(b)—The general temperature of the engine house should be kept between 50° and 60°.

(c)—The recommended method for heating is by hot air driven by fans through permanent ducts, which should be under the floor, where practicable. The fresh air supply should be taken from the exterior of the building and no recirculation allowed. It should be delivered to the pits under the engine portion of the locomotive. It should be heated as far as possible by exhaust steam, supplemented, as required, by live steam.

**Window Lights.**

(a)—The disadvantages of skylights are so much greater than their advantages as to make them undesirable.

(b)—Windows in the outer walls should be made as large as practicable with the largest glass or light area consistent with the requisite strength. In general, the lower sill should be not more than 4 ft. from the floor, and only sufficient space left between pilasters and sides of window frames and girders and window heads to properly secure the window frames. Windows or transoms as large as practicable should be provided over all doors where locomotives enter. Window lights in doors are objectionable on account of difficulty of maintenance.

**Electric Lighting.**

General distribution of illumination should be provided between pits by arranging a number of lights to avoid shadows and to give good light for workmen at the sides of the locomotives. There should be plugged outlets for incandescent lamps in each alternate space between pits.

**Piping.**

(a)—The engine house should be equipped with piping for air, steam and water supply, and where desired, piping for a washout and refilling system should be installed. Where this system is installed, the blow-off lines should be led to a central reservoir; where this is not used, the blow-off lines should be led outside the house.

(b)—The steam outlet should be located near the front end of the boiler. The blow-off pipe, the air, the washout and refilling water and the cold water connections should be near the front end of the firebox.

Connections need only be provided in alternate space between stalls.

**Tools.**

There should ordinarily be facilities provided for hand tools and for the location of a few machine tools, preferably electrically-driven.

**Hoists.**

Hoists with differential blocks are generally used for handling heavy repair parts, and suitable provision should be made for supporting them.

## SAFETY FIRST.

IN spite of all that has been written concerning the origin of safety movement, it will interest manufacturers to know that the earliest record of systematic eye protection is that of the Crane Co., Chicago, who in 1897 began to provide eye protectors for its men, and in 1898 put this work on a systematic basis, giving the glasses to the men free of charge, and requiring operators, as far as possible at that time, to wear the glasses constantly when they were exposed to flying bits of metal, emery, dust, glare and hot metal.

Dr. A. M. Harvey, who at that time was and still is their chief surgeon, was the originator of this plan of providing glasses for the men, and the fact that since they have been providing glasses, their eye injuries have been cut down to an extremely low point, proves the value of having workmen protect their eyes in the shops. The Crane Co. posted signs conspicuously at various points in the shop drawing the attention of the men to the necessity of using glasses, and to the fact that the glasses were being provided by the company free of charge. This corporation is one of the foremost in the safety movement

SHRAPNEL SHELL MACHINING DEPARTMENT OF A LEADING CANADIAN ENGINEERING ESTABLISHMENT.

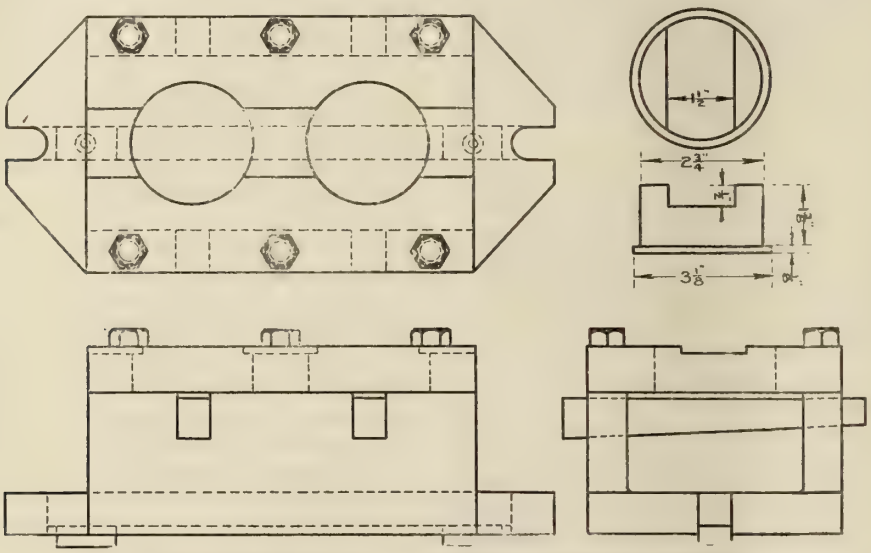
A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## A MILLING FIXTURE.

By D. S. Mann.

THE dimensioned piece shown in the accompanying sketch is of cast iron, and is used in the construction of an oil engine governor. After being turned, the 1½-in. slot is milled for the governor arm. These are held two at a time in the fixture shown. The top of the fixture is bored to receive the two pieces, being machined on the under side, and held to the main body by the six cap screws. The pieces are slid in from beneath and the wedge driven in to hold them securely. As the cut is being taken on the first, the second is put in place.



MILLING FIXTURE FOR OIL ENGINE GOVERNOR DETAIL.

The holes in the top plate are slightly bell-mouthed below, so that the pieces enter easily. The top plate was not finished on the upper surface, and was left slightly thicker than necessary in order to mill a slot cut through the middle. This served for setting the cutter both central and for height, giving the proper depth of slot.

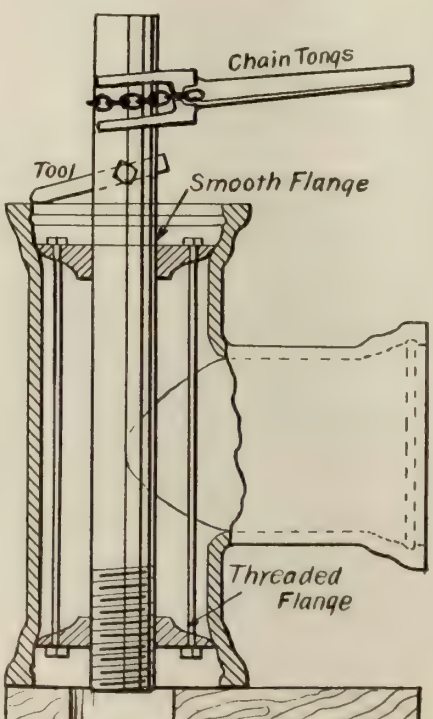
## INGENIOUS WAY OUT OF A DIFFICULTY.

By F. A. MacLean.

THE accompanying illustration will serve to explain a peculiar mechanical difficulty and one man's way out. The method of solution, while not strictly original, will lend itself to a great many emergency jobs. It is, perhaps, not too much to say that the man who can do things without tools is, so to speak, getting to be more and more of a rarity.

There were two 8-inch bell-end cast iron tees which were to be used in conjunction with thin steel, spirally riveted water pipe. There was also some standard wrought iron pipe to be used up, and when the pipe was placed into the bell of the tees, it was found that there was not enough room left to make a satisfactory lead joint.

As we had no other tees on hand and no other pipe that we could use, it looked as though we would either have to order new tees or send those we had to a machine shop to be bored out. Either alternative meant considerable expense and several week's delay which could be ill afforded at the particular time of the year. The writer proposed to the engineer in charge of the work that the tees be corrected on the job and after obtaining that worthy's more or less incredulous consent, the work was accomplished in the following manner:



HAND-BORING CAST IRON TEES.

Two 3½-inch flanges were procured. One was filed smooth, in place of the thread, so that a piece of 3½-inch pipe would work easily in it without play. The flanges were about 7¾ inches outside diameter and fitted nicely in the bottom of the bells of the tees, which were about 2½ inches deep. After being centred, the flanges were drawn up tight by means of two long bolts as shown. The casting was then clamped to a couple of two-inch planks by means of two short bolts through the two remaining holes in the bottom or threaded flange.

For a boring bar we used a piece of 3½-inch pipe of convenient length. After cutting a long thread on one end, a hole was drilled for the tool a distance from the threaded end, such that, when the thread was well started in the bottom flange, the tool was just starting to cut in the top end. After spiking the two-inch planks firmly to a couple of heavy timbers, a large pipe tongs was attached to the top end of the pipe and two men walking around in a circle easily furnished the drive. The cut was regulated by tapping the tool out with a hammer, and the pitch of the screw furnished a very suitable feed.

After once getting started, the job was finished in remarkably quick time. The ends were bored out two inches deep which gave ample room to make a good lead joint. Very little time was lost and the cost was about equal to that of the transportation of the castings to the nearest machine shop.

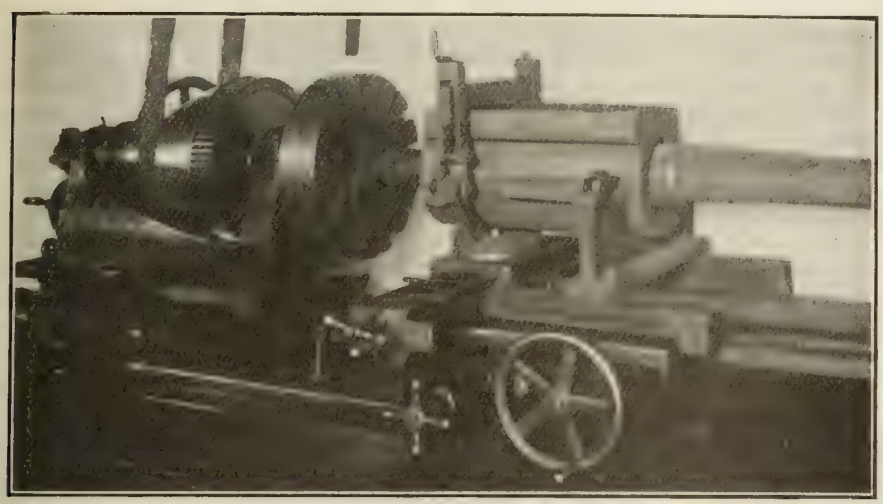
## CAST IRON BORING BARS.

By D. O. Barrett.

IN the modern machine shop of to-day, wherever possible, cast iron is being replaced by steel, as being more durable, and also stronger and stiffer. However, in the accompanying photograph is shown a cast iron boring bar which is doing good service on gasoline engine cylinders. This is rather a curiosity for a good many machinists, and the writer himself was somewhat surprised at the

quality of the work done with a bar of this kind.

The gasoline engine cylinders range from 5 to 10 inches in diameter, and the bars average about 5 ft. in length. They are reinforced by a double ring in the centre with three tapered ribs running up to the same. As will be noted, the bars were placed between centres, and



CAST IRON BORING BAR EQUIPMENT.

the chuck jaws run down on same. Three tools were used in the first and second boring operation, while the final cut was taken with a single tool. These bars were remarkably stiff and performed their work in a very satisfactory manner.

## THE MOULDING MACHINE.

By M. O. S.

WHEN the moulding machine was first put on the market, it was regarded as a hugh joke by the moulder, and although up-to-date foundry men admitted that it was an artistic piece of machinery, there were very few who considered it practical. As time went by, however, and the moulding machine continued to gain ground and become more perfect in its output, some of the more wide-awake foundrymen began to sit up and take notice, for it looked very much as if the machine had come to stay. The rapid developments in the last few years have proved its efficiency and sufficiency beyond a doubt. It is now possible for the foundryman to produce moulds by machinery for almost any casting that can be made in a two-part flask.

No machine ever invented had a harder fight to make good than the moulding machine, for the moulders "knocked" it and did everything in their power to discourage its use. This was a great mistake on their part, for if they had accepted it and given it a fair trial, the handyman and machine operator would never have had the same footing in the foundry as they hold to-day.

### The Accuracy Feature.

That a moulding machine is more accurate in duplicating work than a moulder goes without argument, as no two moulders rap or draw their pattern the same way. A machine-made mould is always the same size, providing it is made by a careful operator. This is an advantage that lots of foundrymen have never considered, and thousands of pounds of metal are wasted annually from castings being over-weight.

We hear many reports about big discounts and scrap in machine moulding, but, when this is traced back, the real cause of these troubles is usually carelessness in making or handling the moulds and not by the failure of the machine to do its work. The one thing that is essential to make machine moulding a complete success is to secure first-class operators, see that these men are instructed in how to temper the sand for the different classes of castings, and also are shown how to ram and pour the different work. Unless these three points are drilled into a green man's head, you will have very little success, and a little time and patience with a new man on the job will give you good returns. In most cases where the results with a moulding machine have not been satisfactory, the machine gets the blame, when the truth of the matter is that the operator has never had the proper instruction that is necessary to a new man on this line of work.

### Selecting a Moulding Machine.

When buying a machine, if there is any doubt in your mind as to the successful production of any class casting, it is wise to consult a reliable manufacturer, for every man who makes these machines understands that the reputation of his product depends upon the accuracy of his judgment on this point. His opinion is, therefore, valuable. Another question to be considered in buying a moulding machine, is whether it will pay a sufficient return on the money invested.

A very important detail in connection with the making of moulds by machinery is that there is not nearly as much expense required to keep the patterns in repair, as the pattern plates are not subject to as much damage as the gated pattern, when it is used in a sand or clay match or follow-board.

### The Output Feature.

The main advantage of producing castings on the moulding machine is the great increase in output. This is many times that of the moulder. There are numerous other ways in which it is a great boon to the foundryman. It gives him good, uniform castings without high priced skilled labor; the latter being sometimes difficult to get. The best proof that the moulding machine has come to stay is that on investigation it will be found that the largest and most up-to-date foundries in both the United States and Canada have hundreds of them in operation, and are not only satisfied with the results obtained from them but are installing more from time to time.

## MAIL MATTER WAR TAX.

THE Post Office Department having given notice a week or two ago in connection with the War Revenue Act that all letters and postcards mailed in Canada for delivery in Canada, the United States of Mexico, and letters mailed in Canada for delivery in the United Kingdom and British possessions generally, or wherever the two-cent rate applied, should in addition to ordinary postage carry a one-cent stamp as a war tax, and also having notified the public that such war tax, while it should be paid preferably by the postage stamp marked "war tax," could, if such stamp were not available, be paid by an ordinary one-cent postage stamp, is now issuing further notice to the effect that postage stamps may be used for the prepayment of war duties on bank cheques, bills of exchange, promissory notes, express money orders, proprietary or patent medicines, perfumery, wines or champagne, as well as upon letters and postcards, postal notes and post office money orders, the intention being to provide facilities in those portions of the country where excise stamps are not readily available. This, in view of the fact that postage stamps may be obtained at all points over the whole country, and in many places where there is no collector of inland revenue, and where no inland revenue stamps could be obtained, is a distinct convenience to the public, and no doubt will be largely taken advantage of.

## CONCERNING CORE COMPOUNDS.

By "Melter."

CONDITIONS under which core compounds are selected do not appear altogether satisfactory, either from the standpoint of consumer or from that of the producer. This, however, is not surprising as the materials involved differ greatly in composition and are subject to varied applications.

Cores are of two kinds—green sand and dry sand. Those of the former will not be considered here as they do not require compounds to create binding power but rely altogether on the shape of the grains of sand.

### The Sand Feature.

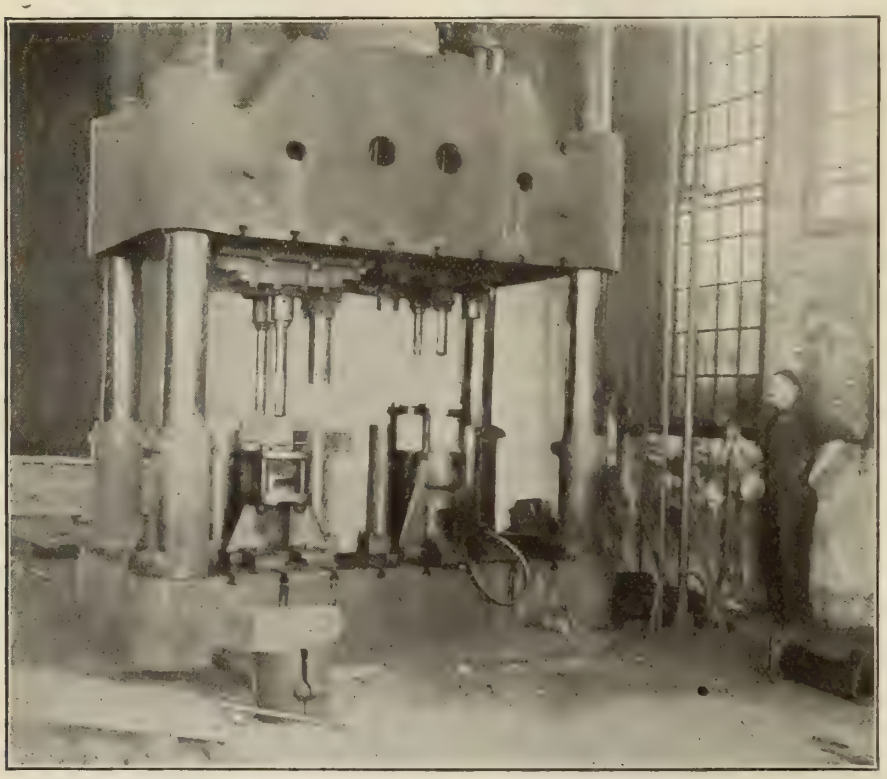
The suitability of a core for any special line of work depends largely on the nature of the sand and binder mixed with it. The chemical composition, the degree of fineness and shape of grains of sand are all-important factors. A sand high in alumina will bake harder than one with a smaller percentage of alumina and the harder condition would be detrimental to good venting. The coarser the sand, other things being equal, the greater will be the strength, at least up to a certain limit.

Organic matter gives bond, but burns out when molten metal comes into contact with it, causing the core to fall or crumble. For this reason, river sands are better than bank sands as all foreign matter is washed out. Iron, manganese, magnesia and lime are all detrimental, and have the effect of causing the core to crumble as already noted.

A medium coarse grade of sand should be used, say, with a degree of fineness of from 55 to 75. A grade coarser than this does not permit of its voids being all filled by the binder, and the result is a weak core. For instance, a 35 grade sand when new was 40 per cent. weaker, comparatively, when mixed with the same proportion of compound, sand and clay wash, and baked for the same length of time and at the same temperature as a 50 grade sand. The degree of fineness of a sand may be found from a sieving test by multiplying separately the number of grains passing through each sieve by its mesh number, adding the results and dividing the whole by 100. Sieve meshes of 100, 80, 60, 40 and 20 are used.

The most convenient way is to weigh out exactly 100 grains of sand, sift for one minute on the 100 mesh sieve, weigh what goes through, sift the balance on the 80 mesh sieve for one minute, and so on. Any loss is counted on the 60 mesh, and what does not go through the 20 mesh is credited to the one mesh sieve. If the sand is very fine, more binder will be required and a close hard core with poor venting will result. It is possible to use 85 per cent. old and only 15 per cent. new sand and get good satisfaction. If machine mixing is practical, more old sand can be used than when mixing is done by hand.

It is not beneficial, however, to run up old sand much beyond 85 per cent. Used sand has the alumina (clay) burned out, and each grain of silica has a coating or film of carbon around it. This film of carbon does not permit the binding material to be as effective as it would be if new sand were employed. If there is much fine sand in the old, more binder will be required as the dust needs as much binder as is necessary for the grains.



SHRAPNEL SHELL FORGING WITH IMPROVISED PRESS EQUIPMENT.

The illustration shows a 750-ton press, normally used in a Canadian plant for boiler work, adapted to the production of shrapnel shell forgings from the billet. The short and long dies are for the first and second operations respectively. An output of 1,600 shell forgings per day was achieved. Special equipment has since been installed.

### Core Binders.

Core binders may be divided into four groups—dry compounds, oil, paste, and those which are capable of being dissolved in water.

### Flour.

Flour is a paste binder. It burns out easily and is, therefore, good for long thin work, although it has very little green binding power. The core should be used almost immediately, as moisture is taken up from the air and moulds.

When using flour, a good brand should be had, as it is the starch and glutin which gives binding power. Poor grades of flour are yellow, mealy and oily because they contain bran. They are high in fibre, fats and ash and create more gas. Tests have shown that a flour containing 50 per cent. less crude fibre, fat and mineral matter had 65 per cent. more strength than the inferior product, and 25 per cent. less flour was required to obtain equal strength which result would more than counteract the difference in cost. It has been found that some flours are adulterated with as much as 40 per cent. mineral matter. This should not be over 1 1-3 per cent. Fat, on the other hand should not exceed 2½ per cent., and fibre 1¼ per cent.

A simple test of further difference

invisible to the naked eye, is to spread out on a piece of glass a small portion when the yellow color is easily seen. Another way of testing is to mix a little dough and try for toughness and dryness. A strong flour is shown by its readiness to absorb water, and make a clean dough that shows tenacity when pulled out. This result will be accentuated if the dough is left exposed for a short time before trying. If, in working, it is still sticky, the flour is not so good, but if it break short it is undoubtedly inferior.

### Oil Binders.

Oil binders are made from linseed, fish, mineral oils and resin. Clay absorbs oil and therefore it is not beneficial to mix the two. Oils and gums flow through the sand and get in between the particles, while flour, resin and starch do not, but just bind adjacent grains. This segregation of binder causes an excess of gas at the point of segregation. Oil cores have very little green binding power though they are better than paste or dry binders. Oils containing mineral oil need longer to bake because the mineral adulterant must be volatilized before gums or pitches act.

### Dry Compounds.

Dry compounds are made up of resin, pitch, dextrin, coke dust, and sometimes a little sawdust is added to facilitate removal from the casting. Dextrin is a green binder which is soluble in water and therefore flows to the contact points of grains of sand, when there is sufficient moisture added. Resin will not stand a high heat when baking as it melts at from 100 to 140 C. It is not soluble in water and has no green binding power. Pitch when in contact with molten iron forms coke which will not clean out.

### Binders Soluble in Water.

Binders which are dissolved by water are molasses, sour beer, glue and the by product of the sulphite paper industry. The latter is very plentiful in Quebec Province, is strong, cheap, a good green binder, and can be used with clay wash or mixed efficiently with any other binder. It is composed of gums and resinous liquors which flow through the sand, giving contact at all points.

### Testing Compounds.

In testing compounds, the relative cost per pound should be figured and a set of test cores made with constant quantities of new and old sand. The amount of compound should vary so that each set of cores costs the same amount. A convenient core box is a mold used for cement testing, and having enlarged ends for gripping in the test machine, while the area on which the load is applied is exactly one square inch. Some people prefer to use test cores 2 ins. square by 13 ins. long, and test transversely on 12 ins. centres. It is immaterial, however, what size bar is employed.

### Core Tests.

Cores are examined for green binding power, change of shape, time of drying, appearance of exterior and interior, and strength. In recent tests, some cores even made of new molding sand having a degree of fineness of about 55. These were 300 per cent weaker than when made from the same old moulding sand having the same degree of fineness.

Another set of cores were made from new core sand with a degree of fineness of 35, and these cores were very much weaker than anything tested. The latter result was possibly due to the voids being too large in proportion to the quantity of compound used. The two tests confirm, however, that it is necessary to have a sand carefully selected as to size shape of grains and freedom from vegetable matter.

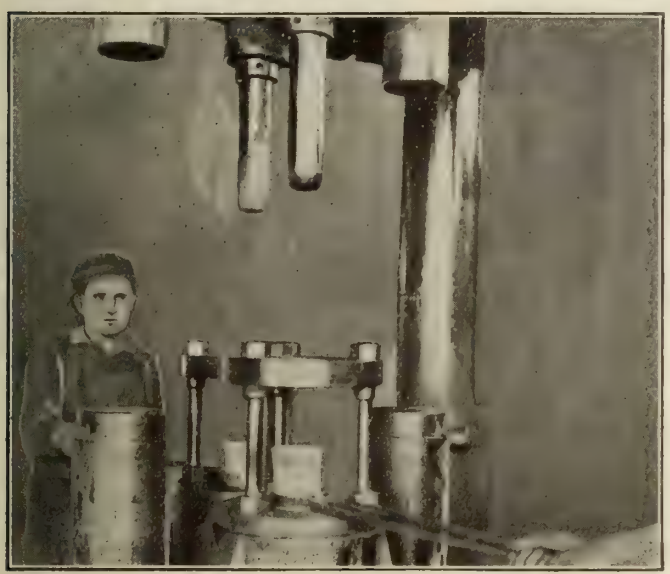
We found also that the by-product from the paper industry (sulphite process) could be used in the proportion of 55 sand to 1 binder with the same amount of clay wash as the latter; that it was 130 per cent. stronger than the cheapest oil tested; 150 per cent. stronger than the two dry black compounds tested, and about 140 per cent. stronger than flour. All were mixed with a constant quantity of the same sand, placed in the oven at the same time, and given the same degree of heat for the same period. The amount of binder, however, was varied in quantity according to the cost, so that all cores required the same amount of financial outlay. A number of the compounds tested contained the following substances:—

Black Compound.—Pitch, coal, resin, sawdust.

Oil Binder.—Dynamo oil, linseed oil.

Paper Industry By-product. — Gum resin, dextrin, pitch, sour beer.

Although the dollars and cents savings on the adopted practice over that recommended are not apparently very large, when taken in conjunction with the better casting features, there is to be noted a quite appreciable over-all benefit.



SHRAPNEL SHELL FORGING WITH IMPROVISED PRESS EQUIPMENT.

Start of second operation; two shell forgings being completed at one time.

Second operation completed; two finished shell forgings seen on either side of press dies.

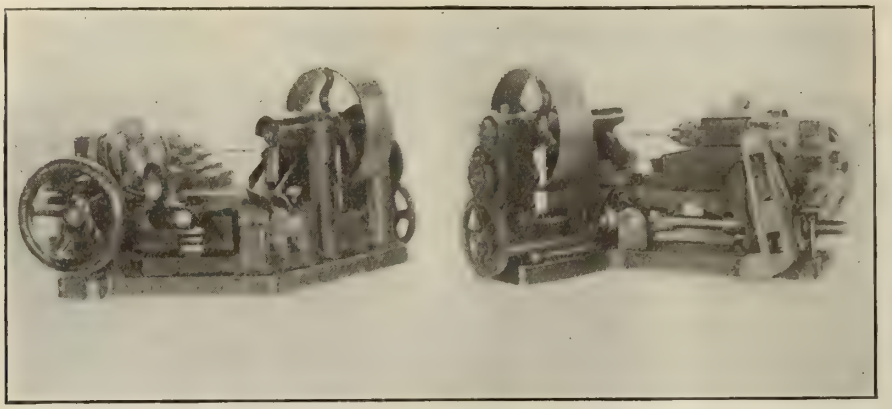
A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## AUTOMATIC DRILL FLUTING MACHINE.

FOR fluting twist drills, ¼ inch in diameter and smaller, the Bickford Machine Co., Greenfield, Mass., has developed a machine which in its design embodies several quite interesting features.

The machine is fully automatic for both forward and return movements of the carriage as well as indexing between the two flutes of the drill. The angle is constant between the cutter spindle and line of carriage travel, a special device providing increase of lead and thereby changing the angle of the cutting lip of the drill.



FIGS. 1 AND 2. AUTOMATIC DRILL FLUTING MACHINE.

Fig. 1 illustrates the method of driving the feed through spur, bevel and worm gearing from the cutter spindle to the cross shaft which carries a crank wheel and gives movement to the carriage through the L-shaped arm as shown. The peculiar shape of this arm is necessary in order to give a constant rate of feed when the crank wheel is making that part of its revolution while the drill is being cut.

A simple process of fluting the surfaces in contact prevents slipping where the link from the upper end of this arm attaches to the carriage, the same method being used to attach the crank pin, it being adjustable for different lengths of travel for the carriage. As shown, the carriage travels on a frame arranged to swing on the bushings which form the bearings for the crank wheel shaft, the front end of this frame carrying the bushing through which the drill is milled.

A lever underneath has one end arranged to swing on a stud provided with elevating screw and clamped to the frame of the machine, while the other end is carried downward by a cam on the crank wheel shaft during the forward movement of the carriage, this drop being greatly increased at the end of the travel of the carriage. A short link connects this lever with the swinging frame and thereby gives the increase of thickness to the web of the drill and also drops the drill free from the cutter for the return stroke.

Fig. 2 shows the method of obtaining the spiral, also the increase twist. The drill or work spindle is spur geared to a shaft carrying a bevel pinion in mesh with a bevel gear mounted on the side of the carriage. This bevel gear is revolved by a slotted arm which gets its motion as the carriage moves forward by contact with a small roller adjustably attached to the frame of the machine. The ratio of the gears is such that a movement of 45 deg. of the slotted arm will give 1¼ revolution of the drill spindle. This is a sufficient amount to give the spiral to the drill and is accomplished by setting the pin which carries the roller at such a height that the arm will make the necessary swing from its vertical position while the drill is being fluted. As the pin travels in a hosizontal direction relative to the centre of the bevel gear, the speed of revolution of this gear will be constantly decreased, thus giving the increase in length of the spiral to the flute of the drill.

The upper end of the swinging arm carries a short shaft on one end of which is a rectangular button, and on the other end a disc with four pins so arranged that, each time the carriage returns, this button is given a quarter turn by a latch in the top of the carriage and presents first a side and then an end to a block on the bevel gear. This gear is arranged to stop at a certain position as the carriage comes back and the button picks it up on its forward movement, the difference in position between the contact of the side or end of the button being equal to one-half a revolution of the drill spindle.

The cut shows the position of the carriage just as the button has made its quarter turn and is ready to pick up the block on the bevel gear with its end. The back-lash of the gearing is taken up during the return stroke by a pull spring and chain running over a grooved pulley. A 2 to 1 pair of gears throws out the feed worm on completion of the second flute of the drill. The hand wheel is attached for convenience in setting up the machine, as giving it a single turn performs the entire operation of making one flute.

A special form of guard and an oil spout allow the cutter to be flooded with oil or compound and carry all the chips to a strainer in the oil tank. The machines are designed to set in a row on a bench with a long trough to take the oil from each to a supply tank where the pump is located. Each is designed to use a high-speed cutter and has a productive capacity of 30 drills per hour of the ¼-inch size, change gears giving a range of five different feeds for smaller drills.

## PORTABLE POWER PLANT.

EVERY machine shop, foundry, manufacturing plant and garage has at some time felt the need of a portable drill and grinder capable of doing really heavy work. The portable power plant shown in the illustrations combines all the advantages of a drill press and stationary grinder, and possesses, in addition, features that make it suitable for many applications where these tools could not otherwise be used. Fig. 3 shows the outfit being employed to remove the scale and corrosion from ammonia condensing pipes.

FIG. 2. PORTABLE POWER PLANT SHOWING FLEXIBLE SHAFT AND DRILLS.

The complete power plant consists of

a revolving tool bit socket mounted on the end of a flexible shaft which is driven by a Westinghouse Electric Co. motor through a variable speed friction disc device. The motor and friction drive are mounted on an iron base to which swivel casters are fitted, and the

FIG. 3. REMOVING SCALE FROM AMMONIA CONDENSING PIPES.

unit is enclosed in a metal case fitted with handles to facilitate carrying.

Adjustment is provided to take up wear on the driving disc, and to vary the contact between the discs for various classes of service. By means of a lever, speeds can be obtained at the tool, and the tool can be stopped without shutting off the current from the motor. By the use of attachments, eighteen speeds ranging from 165 to 3,200 r.p.m. can be secured for grinding, drilling and polishing.

The power plant is built in sizes from ¼ to 1 h.p., and the largest size will accommodate drills up to 1½ inches in diameter. Flexible shafts range in

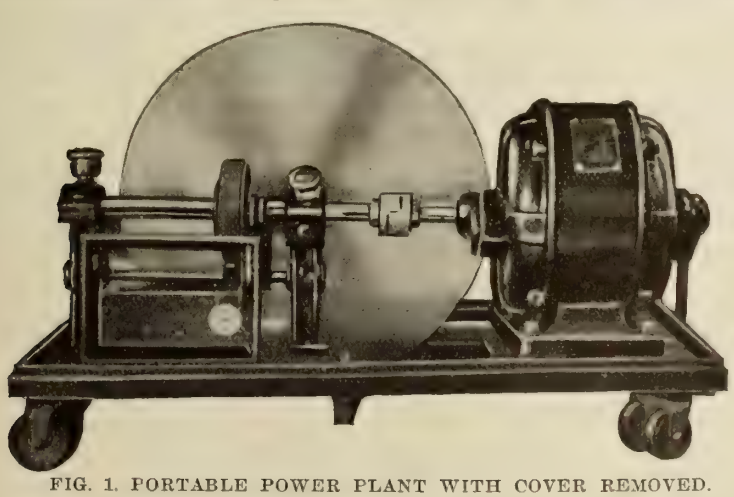


FIG. 1. PORTABLE POWER PLANT WITH COVER REMOVED.

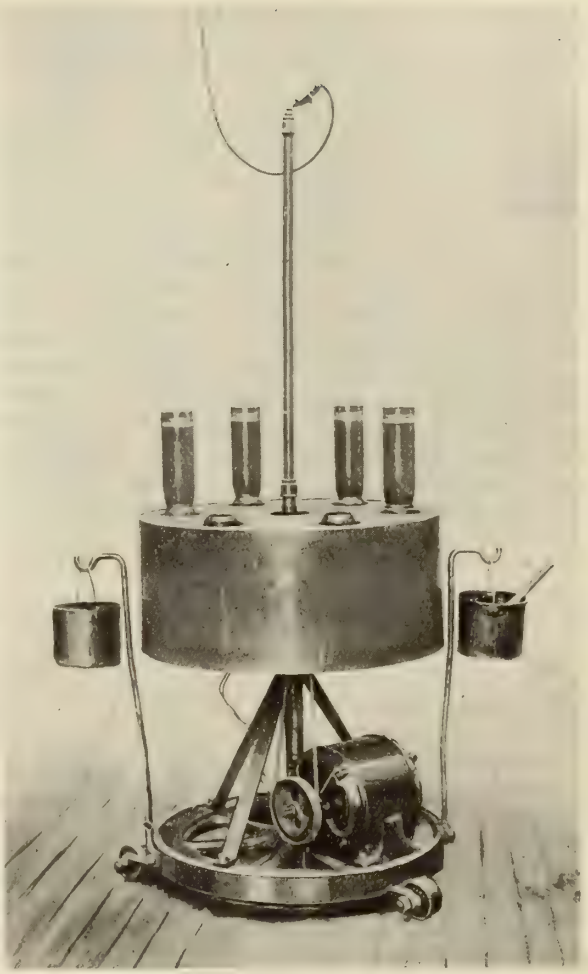
length from 5 to 10 feet All sizes are driven by Westinghouse motors and are built for operation on any commercial circuit, either direct or alternating current, by the United Manufacturing Co., Kansas City, Mo.

## SHRAPNEL SHELL PAINTING MACHINE.

THE machine here illustrated has been designed specially for the purpose of painting shrapnel shells, and is being made by the Canadian Fairbanks-Morse Co. at their Toronto plant. Although intended for 18-pounder shells, with modifications, shells of different calibre can also be painted. Easy operation is a prominent feature.

The shell is placed nose downwards into a socket, which revolves at about 250 revolutions per minute. No clamp or folding device is required, as the weight of the shell is sufficient to keep it in place. The sheet steel cover shown rests on the table, holding the sockets and protects the mechanism inside. The table containing the six sockets revolves on ball bearings at the will of the operator, and is independent of the mechanism rotating the sockets.

The belt from the motor is carried over two guide pulleys to a horizontal wheel running on ball bearings with a grooved periphery. Attached to this wheel is a sprocket wheel smaller in diameter, which is connected by a chain drive to a similar wheel of larger diameter secured to the spindle of one of the rotating sockets. On this spindle is another and smaller sprocket wheel, which is connected by an endless chain to a similar wheel on each of the other spindles. By this arrangement all the socket spindles revolve at the same speed independent of the movement of the table holding them. The standard is made of wrought iron pipe, secured to the base by stays and carries the table



SHRAPNEL SHELL PAINTING MACHINE.

and operating mechanism. The pipe is wired for the motor, and can be connected to the lighting circuit.

The first paint coat is applied by means of a cloth, and to remove the shell, a pair of tongs are used which grip on the copper band. The second coat is applied with a brush, as is also the third coat. While the second coat is being applied, a sheet iron stop fastened to the cover is moved into position against the shell to act as a gauge when painting the nose red to the proper width. Stands for paint cans are attached, and two men can work at one time. The machine is portable, and so can be taken to the work without any difficulty. It is claimed that three coats of paint per shell can be applied in less than one minute.

## SHELL MAKING IN GREAT BRITAIN.

THE tonnage and variety of shells now being turned out in the Sheffield district is, of course, stupendous, says "The Engineer," but that information is the sort of thing about which the less said the better in these days. The important point is that they are being made, and at a rate which had hitherto seemed impossible.

At the annual meeting of Hadfield's, Ltd., a few weeks ago, however, an interesting light was thrown upon the operations. A. M. Jack, one of the directors, referring to a 4.5 in. howitzer shell exhibited in the room, explained that it had been turned out at an entirely new installation which had been erected at Hadfield's works in what, in the middle of November, was a field. They had had to design the works, get them erected, order 300 or 400 lathes and other tools and train the necessary men. All that had been done in four or five months, and they were now putting down other plant of equal or greater magnitude.

Sir Robert Hadfield hamself had some equally interesting things to say. They had, he said, introduced several steel developments, including a "sound steel" invention, which reduced waste from 40 to 15 per cent., and the free use of this discovery was offered to any firm during the war for increasing the output of high explosive shell.

Referring to the Government's present efforts to maintain and increase the equipment of the growing army, Sir Robert complained bitterly, that, through the dilatoriness of a former War Minister, the Army had been found unready at a moment of national emergency. As an instance, he said, "We had equipped ourselves with a splendid plant for producing shrapnel on a very large scale. After the Boer War our orders came to an end. We went to the War-office and told them it was a pity to see a fine plant like ours with nothing to do. They shrugged their shoulders and said 'Very sorry.'

"We went a year later, this time taking a photograph of the plant showing that it had been necessary to utilize the building, which was piled up with patterns and models, these being placed on the top of the valuable machinery. Still the same reply, 'We have nothing for you.' It was disbanded, and the use of a plant capable of producing immense numbers of shrapnel or other shell was entirely lost to the nation. In August last, when the war broke out, if we had then had this plant in working order it would have been worth $500,000 to the Empire."

It may be recalled that the big extensions which have been going on at Hadfield's have their counterpart at Vickers', Browns', Cammells', Jessops', Edgar Allens' and many others of the large British steel works. The increase in output since August is astounding.

## ANOTHER LARGE TELESCOPE ORDERED.

CLEVELAND, Ohio, has again asserted its right to first place among American cities in point of astronomical instrument manufacture with the recent announcement that the Warner & Swasey Co., 5701 Carnegie avenue S. E., has been awarded the contract for the construction of a sixty-inch reflecting telescope for the national observatory of Argentina at Cordoba, Argentine Republic.

This is the second large contract to be handled by the Warner & Swasey Co. within the year. A few months ago the company began the construction of the largest reflecting telescope in the world for use by the Canadian government.

While this new telescope will not rival in size the instrument now under way for Canada, it will rank high among the greatest telescopes in the world and will be the largest in use in the southern hemisphere.

The mirror for the new engine of science is a disc of glass sixty-one inches in diameter, eight inches thick and weighs one ton. The disc of glass from which the reflecting mirror will be made was cast in France, but the figuring of the curves and the delicate and difficult operation of grinding the glass to the proper form and polishing it, prior to the operation of silvering, will be performed under the direction of Prof. Charles D. Perrine, director of the Argentina observatory.

The great tube, twenty-seven feet long and six feet in diameter, with its accessories, will weigh more than fourteen tons. It will be so constructed and so moved by electric motors as to follow the star under observation without deviating the width of a spider thread.

## A RAPID ENAMELING PROCESS.

AN enameling process, the distinctive feature of which is a quick-drying secured by heating the objects treated in large ovens under a relative high percentage of humidity, has been perfected by the Fickling Enameling Corporation, Long Island City, New York. By this method, known as the Radio-enameling process, an automobile can be refinished in three days.

After the initial enamel has been applied by either dipping or spraying, the parts are placed in these specially constructed ovens and dried under a uniform temperature and humidity. Thermostatic control keeps the temperature between 110 and 120 degrees F., and water control on a diaphragm regulates the humidity at a point about 40 per cent. of saturation. Where the character of materials allows, the temperature is increased to as much as 200 deg. The final enamel is subjected to a similar baking at a slightly lower temperature.

Drying in the ovens under the constant relation of temperature and moisture, and the use of water-washed air are said to secure more lasting enamel than is possible by ordinary air drying. Keeping the outer surface green permits the inner layers to dry and set, thus securing a hard and enduring foundation. When dried in the open air the surface becomes hard, while the under coatings may be green for some time. On automobile hoods this results in sweating. W. I. Fickling, president of the corporation, is of the opinion that the radio method will have wide industrial uses because of the time saved in drying. One oven 19 ft. x 6 in. x 42 ft. is in use at present and Mr. Fickling holds that the method would be efficient with even a larger oven.

Vol. XIII. APRIL 15, 1915 No. 15

## PRINCIPAL CONTENTS.

Concerning the Selection of Suitable Gear Pitches .....305-308
Railroad Engine Houses .....308-309
General ..... 309
Safety First.
Production Methods and Devices .....310-311
A Milling Fixture....Ingenious Way Out of a Difficulty....Cast Iron Boring Bars.
General ..... 311
The Moulding Machine....Mail Matter War Tax.
Editorial Correspondence .....312-313
Concerning Core Compounds.
Progress in New Equipment .....314-315
Automatic Drill Fluting Machine....Portable Power Plant....Shrapnel Shell Painting Machine.
General .....315-316
Shell Making in Great Britain....Another Large Telescope Ordered....Coming Conventions....A Rapid Enamelling Process.
Editorial ..... 317
Shop Standards and National Standards....Chas. M. Schwab an Inspiration.
Selected Market Quotations .....318-319
The General Market Conditions and Tendencies .....319-321
Industrial and Construction News ..... 322

## SHOP STANDARDS AND NATIONAL STANDARDS.

RECENTLY we have received a number of inquiries with regard to Canadian standards of mechanical measurement such as relate to screws, wire gauges, etc. To the great majority of these answer is made that we have no standards as a nation, and that the system of measurement to be employed is left almost entirely in the hands of the individual manufacturer. In the choice of gauges these latter are too often governed by strictly first cost considerations and not by ultimate national economy. A large number of manufacturers, however, are seeking for standards and would gladly adopt national standards if they existed. Under the circumstances, many of our more prominent machine builders have adopted the standards of either the United States or Great Britain.

There is no good reason why the better standards of other countries should not be legally adopted by Canada. These, in most instances, have been prepared at great expense, and have been the result of much laborious work. Besides, they could be appropriated by a new country without sacrifice of national dignity. The work of a body appointed for this particular purpose would then, not be the formulating of standards but the choice of the most suitable, and the fewest possible consistent with completeness.

## CHARLES M. SCHWAB AN INSPIRATION.

THE annual report of the Bethlehem Steel Co. shows net profits for 1914 of $9,378,385, equal to 31 per cent. on the common stock, yet Charles M. Schwab, the president, who practically controls the concern, always has refused, and still refuses, to pay any dividend on these shares. Instead, he proposes retaining the money and putting the business on a thoroughly substantial basis, so that when dividends are begun they are likely to be maintained.

This is without question a sane policy. Experience of the past twelve months shows that a number of concerns in Canada should never have paid dividends. On the other hand, several Canadian companies have without good reason suspended dividends since the outbreak of the war, and thus unjustly treated their shareholders.

Mr. Schwab was the real founder of the combination known as the United States Steel Corporation and was its first president. Differing from his co-directors on matters of policy, he resigned and undertook the reorganization of the United States Shipbuilding Co. Out of this he evolved the Bethlehem Steel Co., which has been brilliantly successful. At 40 years of age, he had one of the most magnificent residences in New York and more millions than he could ever use, but he abandoned this luxurious and comfortable life, and made his home at the main plant in Bethlehem, Pa., worked day and night in the shops; organized and reorganized, until he brought the quality of his product to the highest perfection. He then went out and sold it himself—that is, he made the important sales.

In this respect he combined two qualities that seldom are found together. He is not only a great steel maker, but he is an unusually successful salesman. At one time he is showing his foreman how to improve the quality or the capacity of a department; a few weeks later he may be in St. Petersburg selling battleships, submarines and war material to the Czar and Government of Russia.

There are many shareholders in Canadian corporations who would like to see more of this combination in their presidents and general managers, and this story of Mr. Schwab is published for their inspiration. The selling of a product is generally much harder than its manufacture, and most managers unfortunately prefer the easier life and stay in the plants.

Mr. Schwab is regarded as the greatest steel maker in the world, but we are inclined to the opinion that it is as a salesman that he has done his most brilliant work.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

Montreal, Que., April 12, 1915.—Trade conditions generally have been rather quiet during the week. However, as the opening of navigation approaches, there are being made manifest a number of activities which lead one to believe that conditions will improve shortly. Of course, the improved transportation facilities will also lend an impetus to the export and import trade. Much speculation is at present rife as to just how much actual benefit trade will receive from navigation this year, on account of the shortage of tonnage. The latter conditions will be somewhat relieved, it is understood, by the bringing down from the Lakes of a large number of boats. A considerable contraction in the freight traffic on the Lakes is anticipated and thus the vessels remaining will be able to handle the amount comfortably.

It is not anticipated that there will be as great a volume of steel merchant bars imported from British mills as formerly. All the steel produced in Britain will likely be required for war and domestic purposes. Enquiries for steel products are, however, becoming more numerous and a better tone is developing. Foundries are not doing much, and very little pig is likely to be imported this season. Machine tools present a rather peculiar

situation at present. Certain lines are in great demand, while other lines are practically dead. The metal situation presents a very quiet appearance.

### The Steel Trade.

In structural sections, very little steel is moving, as throughout the province but little building is being done. Merchant bars are, however, in fair demand. Many companies engaged largely in the manufacture of shrapnel shells are also making the rough shell forgings. The shell being manufactured more largely than any other in Canada at present is the British 18-pounder. Round steel bars 3½ inches in diameter are used for this work and a considerable tonnage of this size bar is required weekly. In other lines of merchant bars, little business is moving.

In view of the large order received by the Canadian Car & Foundry Co. for shrapnel shells from the Russian Government, it is reported that this firm are moving their forging plant from Fort William to their local shops. A great part of this contract is being placed in Canada, Western shops participating to a considerable extent.

Tool steel manufacturers are receiving many orders because of the shell business, high-speed steel being used practically to the exclusion of the poorer qualities. Besides, the jigs and fixtures employed in the manufacture of shells require that a high-speed steel and one that holds its cutting edge well under severe usage, be used, otherwise the advantage gained by expensive tooling would be to a great extent lost.

### Pig Iron.

Throughout the country foundries are operating at only a fraction of their capacity and thus little iron is being purchased. It is not likely that Britain will export much pig iron during the war, as it may be required for use at home. Prices are not changed.

### Machine Tools and Supplies.

The demand for machine tools which can be used in the manufacture of shells continues, as more shops are engaging in the work. It is now rumored that orders for larger shells than the 15 and 18-pounders, of the high explosive type, are about to be placed. Old machines are being rebuilt and refitted, standard machines are being tooled up, and machinery manufacturers and dealers are also doing their utmost to supply the demand. Shop supplies are, as a result, showing marked activity.

### Metals.

Generally speaking, the metal situation can be summed up as being very quiet. Copper has advanced in New York, and in Canada the prices have risen in sympathy. Tin has been very dull of late, and spelter has not changed much in price. Lead is up slightly owing to a similar advance in the United States prices. Antimony continues to be a very scarce article, but no change in price is reported this week. Aluminum is quiet.

---

**Toronto, Ont., April 13, 1915.**—There has been no change to speak of since last week in industrial conditions, although the outlook is improving. There is a somewhat better tone in business circles although it is doubtful if there will be much improvement in trade generally until the end of the war. The financial stringency will be felt while the war lasts and meantime all business operations are being conducted on a conservative basis. It also follows that industrial development will be restricted during this period.

The shell industry is developing and some concerns are doing well. If it were not for this business many engineering works would be practically closed down. The steel trade, apart from the demand for shells, is showing a little improvement and the outlook is brighter. The building trade is quiet and there are few enquiries for structural shapes. The situation in machine tool circles both in the United States and Canada is unprecedented, the demand for tools for machining shells being so heavy that the manufacturers in the States are sold out months ahead. Russia, France, England and American firms are all buying tools for making shells.

### Steel Market.

There is little change in the situation in the steel trade except as regards the demand for steel for shells which is increasing. The mills making forgings for shrapnel shells are working to capacity to meet the demand, which is so great that some firms are having to wait for forgings. Those concerns, however, which have forging plants are not affected. Considerable business is being done in round bars for the high explosive shells. It is reported that the Lackawanna Steel Co. has booked an order from Canada for 20,000 tons of 3½ in. x 5 in. rounds. Prices are firmer but unchanged.

Production in the steel trade in the States is increasing principally on account of the demand for steel products from the Allies. Large orders for shrapnel shells and rounds for shells have also been booked for shipment to Europe. Quotations on bars and beams have advanced to $1.20 f.o.b. Pittsburgh.

### Pig Iron.

There is no change in the pig iron situation and the market is quiet. The demand is not sufficient to really test prices.

### Machine Tools.

The difficulty of obtaining anything like satisfactory delivery on tools for making shells has caused more or less of a lull in the trade. Those firms who have recently come into the market for tools will have in some cases to wait two or three months for delivery. The reason of this is, of course, the heavy demand from Europe and the large number of tools required by U. S. firms for making shells. Every suitable machine available, new or second-hand, is being bought up. Ordinary business is picking up, but is still considerably under normal.

### Supplies.

The demand for machine shop supplies is improving and dealers report satisfactory business. Dry red lead has advanced and is now quoted at $7.62 per cwt. Turpentine is 2c higher, being quoted at 71c a gallon. Prices generally are firm.

### Scrap Metals.

The market is quiet, but the outlook is better. Prices are firmer but unchanged.

### Metals.

There is an improved tone in the metal markets, but business is light in volume and consumers are conservative in their buying. The primary markets generally have a quiet tendency with the exception of copper which is strong at advanced quotations. The tin market is unsettled for spot metal, owing to the embargo.

**Copper.**—The demand for copper for munitions of war is heavy and consequently the market is strong. The market has advanced ½c and lake copper is quoted locally at 17¼c per pound.

**Tin.**—The limitations recently placed on the export of tin by the British Government has created some excitement in the New York market, on account of the delay in obtaining spot metal which is being quoted at 53c in that market. London market has also advanced, supplies being scarce. In the local market quotations are nominal at 56c representing an advance of 2c per pound.

**Spelter.**—The heavy demand from Europe continues but the situation is unchanged. Quotations are unchanged and nominal at 12c.

**Lead.**—The lead market is firm but quiet. Prices are unchanged at 5¾c per pound.

**Antimony.**—The market is quiet and unchanged. English brands of antimony are practically unobtainable. Quotations are unchanged and nominal at 25c per pound.

**Aluminum.**—The market is steady and quotations are unchanged at 23½c per pound.

## IMPROVEMENT IN CANADA'S REVENUE.

MARKED improvement is shown in official figures of the Dominion revenue for the three months of the present calendar year. Receipts, since the introduction of the budget, have more than equalled the revenue for the corresponding ante bellum months of last year.

The improvement is shown in the following comparative statement for the months since the outbreak of the war and those of the previous year.

**Total Revenue.**

| | 1913. | 1914. | Decrease. |
|---|---|---|---|
| August | $14,547,853 | $14,946,104 | $ 351,748 |
| September | 15,249,258 | 9,953,093 | 5,296,165 |
| October | 14,225,598 | 10,641,254 | 3,584,343 |
| November | 13,536,981 | 9,495,536 | 4,041,445 |
| December | 12,931,466 | 9,167,940 | 3,763,526 |
| | 1914. | 1915. | |
| January | $11,529,753 | $ 9,897,664 | $1,632,089 |
| February | 9,698,120 | 10,523,344 | *825.223 |
| March | 11,686,901 | 11,641,970 | 46,931 |

*Increase.

The special war tax becomes operative on the 15th of this month. It would appear that the measures taken by the Government to cope with the financial situation created by the war are likely to prove successful.

## CEDARS RAPIDS MFG. & POWER CO.

A NEW contract calling for the delivery of 5,000 h.p. has been closed by the Cedars Rapids Mfg. and Power Co. It has been agreed to deliver over the transmission lines of the Aluminum Co. of America, the above quantity of power to the Northern Power Co., which is located at Messina Springs, New York State. The power will be distributed by the American company to small consumers located within a radius of fifty miles from Messina Springs. Howard Murray, vice-president of the Cedars Rapids Co., states that the new contract has been signed, but that at present it was impossible for the management to express an opinion as to when deliveries would be commenced.

At the present time the Aluminum Co. of America are taking 40,000 of the 60,000 h.p. contracted for, and will gradually increase this amount as new machines at the works are installed. It is expected that before the summer they will be taking the whole of the 60,000 h.p. unless some unforeseen construction difficulties occur. The Montreal Light, Heat and Power Co. are taking all of the 20,000 h.p. called for in their contract with the Cedars Rapids Co.

The new contract with the Northern Power Co. is a very favorable one, inasmuch as it does not call for any expenditure on the part of the Cedars Rapids Mfg. and Power Co., but simply means adding 5,000 h.p. to the quantity already being supplied to the Aluminum Co.

**Col. A. Bertram**, chairman of the Dominion Shell Committee, has been promoted to the rank of Brigadier-General, attached to the General Staff.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

## Engineering

**Orillia, Ont.**—The Fisher Motor Co. has started work on a contract for shrapnel shells.

**Seaforth, Ont.**—The Bell Engine Works will install machinery to manufacture shrapnel shells.

**Newmarket, Ont.**—The town council has decided to buy a 16 h.p. electric pump for use at the waterworks station.

**Thorold, Ont.**—Fire which broke out on April 6 completely destroyed the large moulding shop of the Thorold Foundry Co.

**St. Mary's Ont.**—A by-law will be prepared in connection with the installation of a new street lighting system and gasoline engine.

**Montreal, Que.**—The Drednot Motor Truck Co. have secured a factory at Wellington and Nazareth streets and will install additional machinery.

**London, Ont.**—P. A. Seeker of Marine City, Mich., has purchased three acres of land just east of here for the erection of a $65,000 automobile factory. Some 50 hands will be employed on the start.

**Hespeler, Ont.**—A. B. Jardine & Co. has just made a large shipment of portable field forges to the military department at Ottawa, and are completing a carload of general blacksmith tools, which they will ship to the West in the course of a few days. The firm expects to be ready to start the manufacture of shells inside of two weeks, and they will then run their factory night and day.

## Municipal

**Welland, Ont.**—The town council is considering the question of installing an incinerator.

**Toronto, Ont.**—Tenders are being called for an incinerator to be installed on the Island.

**Toronto, Ont.**—Fire at the John Taylor Soap Works, Front Street, on April 11, did $13,000 damage.

**Toronto, Ont.**—It is reported that the T. Eaton Company may build a factory at Mount Dennis, near here.

**Preston, Ont.**—A by-law will be voted on by the rate-payers on April 26, to raise $25,000 for the Preston Mills Co., who will manufacture handles and wood products.

**Saskatoon, Sask.** — The Board of Trade announces that a fibre company from the United States is about to build a flax mill there.

**Lindsay, Ont.**—A New York concern are negotiating with the Town Council regarding a suitable plant for manufacturing explosives.

**Toronto, Ont.**—The Board of Control recommends that the contract for an incinerator to cost $49,000 be awarded to the Canadian Griscom-Russell Co., of Montreal.

**Swift Current, Sask.**—A by-law to raise $75,000 for the completion of the electric light and power plant, and another to raise $25,000 for the purchase of a city hall site, have been introduced in council.

**Vancouver, B.C.**—A resolution passed by the West Kitsilano Ratepayers' Association, urging that the city take steps to install its own electric lighting plant, has been adopted by the Central Ratepayers' Association.

## Electrical

**Blenheim, Ont.**—A hydro-electric system will probably be installed here. The cost is estimated at $14,000.

**Beamsville, Ont.** — The Dominion Power & Transmission Co. will inaugurate a meter system here and henceforth all lighting and power contracts will be made on meter basis.

**Kincardine, Ont.**—The water and electric light commission will purchase a number of brackets for electric lamps. Incandescent lamps will be used instead of the present arc lamps.

**Kamloops, B. C.**—Hydro-electric by-laws aggregating the sum of $85,000 were voted upon on April 6th, passing with a large majority. This money will be used for completing the hydro-electric system upon which half a million dollars has been expended. The city anticipates great results through their fine power plant, which it is expected will be in operation in course of a few weeks.

## Railways—Bridges

**London, Ont.**—The official opening of the London & Port Stanley Railway, which will make the first hydro-radial in operation in Ontario, is to be held on July 12. The road will be formally opened by Sir Adam Beck.

**Ottawa, Ont.**—At a meeting of the Railway Commission held here on April 6, Assistant General Manager Alfred Price, of the C. P. R., stated that all locomotives would be fitted with a new type of dump ash pan.

**Saskatoon, Sask.**—The Commissioners are recommending to the city council that a new diamond crossing be installed on Twentieth street. The total cost of installing the new diamond, including labor, is estimated at $1,436.25.

**Brantford, Ont.**—It was stated by an official of the C. P. R. that, though no official decision has yet been given, the Lake Erie & Northern Railway from Port Dover to Galt, through Brantford, will be electrified, to run in conjunction with the Galt, Preston & Hespeler Railway, owned by the C. P. R.

**Brantford, Ont.**—The first report of the Brantford Municipal Railway Commissioners shows that total receipts were $33,411.91 for the period August 4 to December 31, and after paying expenses of $25,506.85, there was a balance of $7,905.05 to pay interest on purchase price and bonded debt. Passengers carried on the street railway totalled 300,250; car mileage was 88,892, and total receipts amounted to $13,145.97. The Grand Valley Railway carried 93,231 passengers on 68,294 mileage, with receipts of $18,551.45.

## General Industrial

**Riverton, Man.**—A pulp mill may be established here by an Eastern syndicate.

**Toronto, Ont.**—J. A. Livingstone of Renfrew has purchased a plant here and will make concrete blocks and similar products.

**Sherbrooke, Que.**—The Board of Trade is negotiating with a firm in New York who may locate a plant here. J. S. Mitchell & Co., of Sherbrooke, are interested.

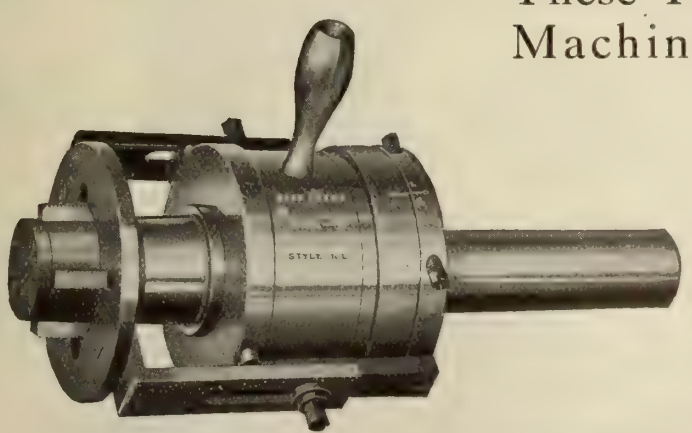
# CONSIDER

## What a Geometric Collapsing Tap Will Do For You

*Send for our Catalogue. It tells the interesting story.*

These Taps are used on Turret Head Machines or on Live Spindles.



Geometric Class NL Collapsing Tap as Equipped for Shell Work.

Geometric Collapsing Taps are very busy at present on Shrapnel Work, but they are arranged for all classes of thread tapping above ¾-inch diameter.

**THE GEOMETRIC TOOL CO.**
**NEW HAVEN, CONN., U.S.A.**

**Canadian Agents:**
Williams & Wilson, Ltd., Montreal.
The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg, and St. John, N.B.

**Toronto, Ont.** — The David Smith Lithographing Co. has bought a factory building at the corner of Strickland and Noble Streets.

**Blenheim, Ont.**—A syndicate has been formed with a capital of $10,000 to establish a tobacco factory. E. G. Thompson and T. B. Shillington are interested.

**New Westminster, B.C.**—The Brackman-Ker Milling Co. are making arrangements for an early start on the construction of the new elevator. Gardiner & Mercer are the architects.

**Hamilton, Ont.**—The interior of the Parker Dye Works, East King street, was entirely demolished on April 1, when one of the gasoline tanks exploded. The damage is estimated at $10,000.

**Lindsay, Ont.**—Horn Bros.' industrial proposition was discussed at a meeting held on April 8. The company propose to erect a $55,000 factory and install $75,000 worth of machinery. It is proposed to commence building on Oct. 1.

**Goderich, Ont.**—J. Ransford, of the Goderich Salt Co., proposes to install a modern salt plant here and increase the output to over double the present capacity. He asks free water and light, 10 horse-power from the hydro-electric and exemption of taxes for ten years.

**Brantford, Ont.**—The Canadian Westrumite Co., recently reorganized, which took over the plant of Westrumite, Ltd., will shortly commence operation at the local plant, which will be considerably enlarged and improved. W. D. Preston, of New York, has been appointed manager.

# Trade Gossip

**The Napanee Iron Works, Ltd.**, Napanee, Ont., have appointed F. H. Hopkins & Co., Montreal, sole sales agents for Canada for their "Napanee" hoisting engines.

**A. H. Winter-Joyner, Ltd.**, Toronto, who handle street lighting equipment, electrical indicating and recording instruments, etc., have removed from 76 Bay street to 100 Wellington street, west.

**Fraser & Chalmers of Canada, Ltd.**, announce that on May 1, on account of the necessity for increased space, brought about by their rapidly-growing business, their head office will be transferred to 59 Beaver Hall Hill, Montreal.

**A new charter** has been granted to William R. Perrin, Ltd., to continue the manufacture of hydraulic power screw and filter presses and abattoir machinery, formerly carried on by W. R. Perrin Co.

**Tractors to Haul Guns.**—The Russian Government have purchased the entire stock of 70 horse-power gasoline tractors belonging to Marshall, Sons & Co. (Canada), Ltd., and which are at present in warehouse on the Industrial site at Saskatoon, Sask. Shipment will be made via Vancouver and Vladivostock.

**Brantford, Ont.**—John A. Sanderson, president of the Adams Wagon Works, has returned to the city after a two months' business trip in the Old Country. Mr. Sanderson was accompanied by Gordon Cockshutt, who travelled in the interests of the Slingsby Manufacturing Co. Substantial war orders were secured by them.

**Canada's First Shrapnel Shell.**—Hon. Sam Hughes, Minister of Militia, was presented last week by the Nova Scotia Steel & Coal Co. with the first 18-pounder shell forged and finished in a Canadian workship. It was mounted on a mahogany stand. The shell was made from Nova Scotia open-hearth steel, and was presented by the Hon. Col. Thos. Cantley.

**ALLIES PURCHASING AGENTS.**

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**British.—Lieut. Johnston and A. C. Billing, Ritz Carlton Hotel, Montreal.**

**French—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**

**Russian — Messrs. S. Ruperti and Aiekieff, care Military Attache, Russian Embassy, Washington, D.C.**

**Shell Manufacture at St. John, N.B.**—The Commissioner of Public Safety, St. John, N.B., has recommended that the machinery hall on the exhibition grounds be rented to T. McAvity & Sons, for the term of one year or portion thereof, as may be necessary, for the purpose of manufacturing shells, such tenancy to be terminated at any time by one month's notice on either side. Rental to be at the rate of $500 per annum, payable monthly. Messrs. McAvity are to make all necessary repairs to the boiler and engine at own cost and to pay such extra insurance premium as may be required.

**Dominion Steel Output.**—The output of the Dominion Steel Corporation has been going largely to Great Britain recently, and there the company has meantime a satisfactory outlet for its product if shipping facilities can be assured. A fair improvement in pig iron, wire rods, bars, and wire products is shown in the output for March. The production in tons, is reported as follows:

| | 1915. | 1914. |
|---|---|---|
| Pig iron | 23,669 | 22,619 |
| Steel Ingots | 25,807 | 28,352 |
| Rails | 6,102 | 18,359 |
| Wire rods | 4,543 | 2,981 |
| Bars | 316 | .... |
| Wire and wire products | 3,359 | 2,246 |
| Shipments | 20,086 | 16,813 |

The coal output was 364,542 tons in 1915, compared with 391,887 tons last year.

# Personal

**Captain Malcolm McLeod**, former harbormaster of Vancouver, B.C., is dead at the advanced age of 80.

**Paul Mercier** is acting city engineer at Montreal during the time that city engineer Major George Janin is on active service with the corps of Canadian engineers.

**Capt. B. J. McCormick**, late Industrial Commissioner for Welland, Ont., has left for Hamilton in charge of the third overseas contingent of the 44th Regiment.

**Sam Buchanan**, who for the past twelve years has been superintendent of the Upper Lake Division of the C. P. R. steamship service, will retire from active service on May 1st.

**Arthur H. McGuire**, of St. John, N.B., has been appointed sales manager for the Canada Cement Co., with headquarters in Calgary, Alta. He has been with the company on its travelling staff for some years, and is one of its most valued employees.

**H. B. Smith**, of Owen Sound, was re-elected president of the Northern Navigation Co., at the annual meeting of the company held at Montreal on April 1 last. Mr. Smith was also re-elected as a director of the Canada Steamship Lines, Ltd., of which the Northern Navigation Co. is a subsidiary company.

**John Cowan**, president of the Ontario Malleable Iron Co., Oshawa, Ont., died at his home in Oshawa on April 8, aged 86. Mr. Cowan was born in Tyrone, Ireland, and came to Canada in 1841. He settled in Toronto. In 1866 he went to Oshawa to manage the Cedarvale Ironworks, and five years later or-

# Important Message to Manufacturers of Lyddite Cases

We can furnish you with Collapsing Taps that will do the tapping operations. We realize the exacting requirements necessary to pass inspection and have furnished

# MURCHEY TAPS

that are now doing this same work.

You know that collapsing taps cut tapping costs in two, but do you know that they will do the work better than solid taps and also eliminate stripped threads and consequent rejections?

We want to get in touch with every Canadian manufacturer of these parts, and will be glad to send representative to show what we have done for others.

*All Murchey Tools are Absolutely Guaranteed.*

ganized the Ontario Malleable Iron Co., of which he was president till the time of his death, a period of 43 years.

**W. H. Snell**, general agent, passenger department, of the C. P. R., at New York, has been appointed to succeed the late William Stitt as general passenger agent, eastern lines, at Montreal. Mr. Snell, who is a native of Montreal, joined the C.P.R. as clerk to the treasurer, in 1890. In 1902 he became chief clerk to the district passenger agent at Boston, and two years later was appointed travelling passenger agent of the same office. In 1910 Mr. Snell became Eastern passenger agent at New York, and last year was promoted to general agent, passenger department, at New York.

## Tenders

**Toronto, Ont.**—Tenders will be received by the Board of Control up to Tuesday, April 27th, 1915, for the supply and installation of one sludge pump for the main sewage disposal works, Toronto. Specifications and forms of tender may be obtained at the Works Department, City Hall.

**St. Catharines, Ont.**—Tenders will be received by the Architect until Monday, May 3, 1915, for all trades required for the erection and completion of a new Collegiate Institute to be erected in St. Catharines, Ont. A complete set of plans and specifications may be seen at any reasonable time at the office of the architect, A. E. Nicholson, 46 Queen street, St. Catharines, Ont.

## New Incorporations

**The Rideau Power Co.** has been incorporated at Toronto with a capital of $80,000 to develop water power at Merrickville. Incorporators: Thomas Grattan Kyle, Robert W. Watchorn, all of Merrickville, Ont.

**Simplex Asphalt Paving Co.** has been incorporated at Ottawa with a capital of $100,000 to carry on a business as contractors at Montreal, Que. Incorporators: Frederick H. Markey and Waldo Whittier Skinner, all of Montreal, Que.

**Canada Steam Furnaces, Ltd.**, has been incorporated at Toronto with a capital of $150,000 to manufacture and sell steam and all kinds of furnaces at Toronto. Incorporators: Joseph Denis, W. D. Wilson, of Toronto, Ont.

**The Premier Electric Co.** has been incorporated at Ottawa with a capital of $49,000 to carry on business as electrical contractors at Montreal, Que. Incorporators: Louis A. David, Louis E. A. D'Argy Mailhiot, all of Montreal.

**Meriden Britannia Co.** has been incorporated at Ottawa with a capital of $400,000 to manufacture silverware and electro-plated goods at Hamilton, Ont. Incorporators: George Horace Wilcox and George Munson Curtis, of Meriden, Conn.

**MacIntyre, Haining, Kelly Construction, Ltd.**, has been incorporated at Toronto with a capital of $40,000 to carry on the business of a construction company at the city of Sault Ste. Marie, Ont. Incorporators: Alexander MacIntyre, of Steelton, Ont., and John Nornal Haining, of Sault Ste. Marie, Ont.

**Reliance Knitting Co.** has been incorporated at Toronto with a capital of $200,000 to manufacture and deal in textile fabrics including knitted goods and woven goods at Toronto. Incorporators: Ferguson James Dunbar, B. Taylor, of Toronto, Ont.

**The Pacific Great Eastern Equipment Co.** has been incorporated at Ottawa with a capital of $3,000,000 to manufacture railway cars, wagons, etc., at the city of Vancouver, B.C. Incorporators: Patrick Welch, Edward F. White, all of Vancouver, B. C.

**George McKnight & Co.** has been incorporated at Ottawa with a capital of $40,000 to carry on business as a general engineering and construction company at Montreal, Que. Incorporators: Louis Athanase David and Segfried Hinson Read Bush, all of Montreal.

**Shawinigan Electro-Metals Co.** has been incorporated at Ottawa with a capital of $50,000 to manufacture all kinds of metals, minerals, etc., at Montreal, Que. Incorporators: Howard Murray, Theophilus Hatton Wardleworth, all of Montreal, Que.

## Wood-Working

**Port Dover, Ont.**—The Port Dover Planing Mills Co. will install machinery for the manufacture of chairs and furniture frames.

**Saskatoon, Sask.**—The Rat Portage Lumber Co., Winnipeg, has sold its local sash and door branch to Cushing Bros., who will operate it in connection with its factory.

**Collingwood, Ont.**—The planing mills and woodworking factory of the Bryan Mfg. Co. were destroyed by fire on April 11. The loss is estimated at $70,000, in which there is 80 per cent. insurance.

**Kincardine, Ont.**—There is probability of an addition being built to the Coomb Co. furniture works, as there is not sufficient storage accommodation to supply the wants of the trade.

## Marine

**Ottawa, Ont.**—The sum of $30,000 has been appropriated for the purchase of a new vessel for protecting fisheries on Lake Erie.

**Kingston, Ont.**—The Davis Dry Dock Co. have started to build a pessenger steamer for the Seven Rivers and Lake Couchiching Navigation Co. The craft will be 70 ft. long, 12 ft. beam and 5 ft. deep, and will be built of white oak.

**Montreal, Que.**—Specifications are now being prepared and tenders will shortly be called for the construction of a new ferry boat for the St. Helen's Island service. The city proposes to operate the ferry service.

**Quebec, Que.**—Two lighthouses are ready for service in the river below Quebec. The C.G.S. Druid has left to set the lights at Crane Island and the Beaujeu Banks. The Government ice-breakers Lady Grey and Montcalm have reached Nicolet, and are expected to reach Sorel in the first days of April.

**Montreal, Que.**—The passenger and general cargo service of the Black Diamond Steamship Line, which the Dominion Coal Co. has operated for many years between the ports of Montreal, Prince Edward Island, Sydney and St. John's, Nfld., will be discontinued, according to a statement made recently at the head offices of the company in this city.

**Sault Ste. Marie, Ont.**—Supt. Davis, of the Michigan Northern Power Co., has announced that work on the regulating and compensation structure above the rapids in St. Mary's river would be started April 1. The Great Lakes Dredge and Dock Co. will lay a sub-structure for the dam. These works will be used in regulating the flow of water across St. Mary's Falls, the outlet of Lake Superior, and will keep water level in lakes at an even station. The contracts approximate $250,000.

## Building Notes

**Midland, Ont.**—W. H. Switzer, of Orillia, has been awarded a contract for a school building to cost $29,000

**Victoria, B.C.**—A building permit has been issued to T. R. Cusack for a warehouse to cost $5,000. Luney Bros. are the contractors.

# Catalogues

**Drill Chips** for March is quite up to the usual standard of this publication. The Cleveland Twist Drill Co., Cleveland, O., in this number, make a plea for buying a product on its merits rather than for sentimental reasons, because it happens to be made in some particular city or country as the case may be. The item "Politics versus Business" is interesting reading and contains some pointed remarks.

**The Gilbert & Barker Mfg. Co.,** Springfield, Mass., has issued a booklet dealing with their process for burning fuel oil under low pressure. The process and apparatus used are described and the various uses of fuel oil are dealt with, including interesting tables showing comparison of oil fuel with various gaseous fuels. The illustrations include views of the apparatus and also a number of installations.

**Hydraulic Pumps and Valves** are dealt with in bulletin No. 5,000, just issued by the Hydraulic Press Mfg. Co., Mount Gilead, Ohio. The advantages to be gained by installing only high-grade pumps, valves and fittings with hydraulic presses are dealt with fully. The various styles of equipment are illustrated and described, the illustrations being very good reproductions. Particulars are given of each type of pump shown.

**Hack Saw Machines.**—Perkins & Co., Leeds, England, have sent us a series of leaflets describing the various types of hack saw machines and bench millers which they make. The hack saws described are in various sizes, the largest taking bar stock up to 10 in. diameter. Particulars are given of each size, accompanied by illustrations and brief specifications. A specification and general description is given of the milling machines.

**Mechanical Stoker.**—The Combustion Engineering Corporation, New York, has issued a new bulletin, B-2, describing the type "E" stoker. The bulletin states that this stoker, which is of the underfeed type, is adapted for burning coking or non-coking coals, and that it can be used under all types of stationary boilers. A full description is given covering the construction of the stoker and also of the methods of operation, with special reference to the principal features. The illustrations are very clear and show several views of the stoker installed. The company will gladly mail copies of this bulletin to interested readers.

**Boiler Tube Cleaners.**—The Lagonda Mfg. Co., of Springfield, Ohio, have just published a booklet entitled, "Lagonda Boiler Room Specialties." This booklet describes and illustrates their several types of boiler tube cleaners with latest improvements and boiler quick repair tools. It also covers their automatic cut-off valve and multiple strainers. Copy may be had on request.

**Patternmakers' Grinders,** made by Charles H. Besley & Co., Chicago, Ill. This catalogue deals almost entirely with the No. 15-30-C Besley grinder, although other types very similar in design are also described. A very complete general description is given of the grinder, followed by descriptions of various typical operations, all illustrated. Brief specifications are given of the A and B types of machine. The illustrations show the grinders with various attachments and also in operation.

# Book Reviews

**The Art of Estimating,** by William B. Ferguson, naval constructor, U.S.N., Washington, D.C.—To quote the preface, this incomplete discussion upon the systematic collection and use of unit costs for ordinary estimating purposes has been partly compiled from memoranda issued from time to time within the past four years by the author to the members of the hull estimating and planning staffs at certain navy yards as a part of their instruction and training. The book bears special reference to unstandardized operations as in jobbing or repair work, and is a contribution to the cause of standardization of labor. It contains a great deal of valuable data with regard to accepted methods of planning and estimating in manufacturing works, also the application of the basic principles of logical planning and estimating when dealing with repairs and alterations to vessels. The subject is dealt with fully, and included are a number of graphs, tables and examples. The book contains 97 pages, and is bound in cloth covers.

POSITION WANTED AS SUPERINTENDent or general foreman; with first-class executive ability in handling of men for making of shrapnel. Box 150, Canadian Machinery.

HARKER & KEMBLEY
Machinists and Brass Finishers

Make Your Own Engravings
It doesn't take an expert to operate the GORTON ENGRAVING MACHINE. The ordinary workman can turn out lettering or designs either sunk or in relief, on dies, moulds, tools, patterns, core boxes, label plates, instruments, etc., etc., better than the most skilled hand engraver in the fraction of time the hand workman would take.
WRITE FOR DETAILS.

## Genuine Armstrong Stocks and Dies

Hinged Pipe Vises.

Pipe Cutters. Steam and Gas Fitters' Tools.

Pipe Machines for Threading Pipe.

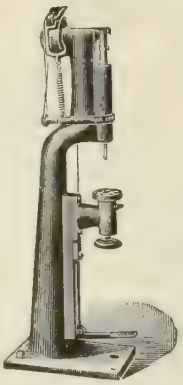
Either Hand or Power.

*Manufactured by*

THE ARMSTRONG M'F'G CO.

328 KNOWLTON ST. BRIDGEPORT, CONN.

NEW YORK, 248 CANAL ST.



## Light and Heavy Riveting

can be done equally well on our ELASTIC ROTARY BLOW RIVETING MACHINE because the force of the blow is always under the control of the operator, and quickly adjusted to suit the work.

The machine is made in several sizes and styles, and every head is perfectly formed, any shape you wish.

Catalogue?

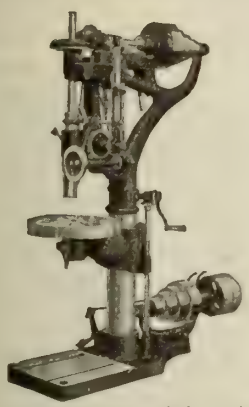
**The F. B. SHUSTER COMPANY**

New Haven, Conn.

Formerly John Adt & Son. Established 1866

Also makers of Wire Straighteners, for rounds, squares, hexagons, etc.

Canadian Agents: A. R. Williams Machinery Co., Toronto.



## Our 23" Mechanic's Drill

has features with which you may not be familiar.

There are eight speeds provided, with quick advance and return.

Stationary Head and Back geared with automatic stop. This drill can be motor-driven and will drive high-speed drills to their utmost capacity. The quality is the same as all "Rockford" quality—the best.

Write for descriptive catalogue.

**Rockford Machine Tool Co.**

Rockford Illinois

Mfrs. of the Rockford Planer and Shaper.

## J.C.McLAREN BELTING

THE J.C. McLAREN BELTING CO. OAK EXTRA TANNED EST 1856

Will Save You Money in Every Day of Service

Modern plant and thorough knowledge of requirements of belting guarantees perfect satisfaction to all buyers. Our belts are the result of using best leather, and our 57 year's experience.

Ask for Quotations.

Belt Driven 4 Plunger Pump.

## HYDRAULIC PUMPS FOR EVERY PURPOSE

Watson-Stillman pumps are designed in types and sizes for every hydraulic pressure service and in one quality only—the best. We carry in stock those sizes most in demand—have the patterns that enable us to build other standard apparatus on short notice. We are always ready to design to meet special requirements and can often modify standard patterns to suit special conditions.

If in need of hydraulic equipment of any kind, write us. Our 60 years' experience and patterns of over 4,000 complete machines qualify us to give you best service.

# Starrett "Mike" No. 3—The Most Used Instrument in the World

Of all the tools and instruments used by machinists and toolmakers in thousands of shops all over the world, one tool stands out as the universal standard—the one-inch Starrett "Mike" No. 3.

Here's to it: It is the first fine tool you buy after you have the usual steel rule and calipers and dividers, when you are getting your trade—and later it is the standby in all your work. The ratchet stop, lock nut, and decimal equivalents make it all you desire. It's as good as new after years of service, because when the spindle wears even a fraction of a thousandth, you can take it up in a second by a slight turn of the sleeve with the little spanner wrench that came with the "mike."

The plush-lined leather case that may be had with the micrometer for fifty cents makes a fitting place to keep the micrometer after the day's work is done.

*A postal with your name and address will bring a free copy of our 320-page Starrett Catalog No. 203, which describes 2100 styles and sizes of fine tools.*

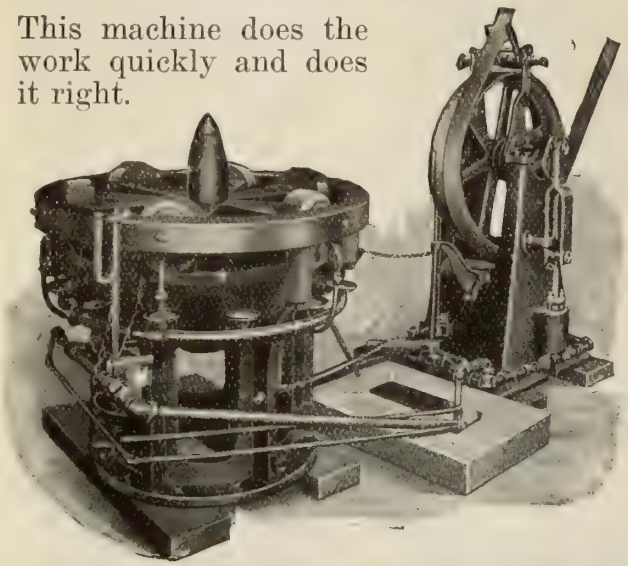
## Hydraulic Banding Machine

**For compressing bands on shrapnel shells and other projectiles**

This machine does the work quickly and does it right.



In writing for information or quotation please advise width and thickness of bands and diameter of shells to be handled.
Machines for our Canadian Customers are built in Hamilton, Ont.
We also manufacture machines for setting wagon and carriage tires, cold.
**Please address all communications to our Rochester Office.**

**THE WEST TIRE SETTER COMPANY**
ROCHESTER, NEW YORK

## Make One Barrel Do What Two Barrels Did Before

THE minute you install one Globe Tumbling Barrel you can pension two of your old-fashioned horizontal barrels and still do a wider variety of work —and do it a great deal better and many times faster.

**GLOBE TUMBLING BARRELS**

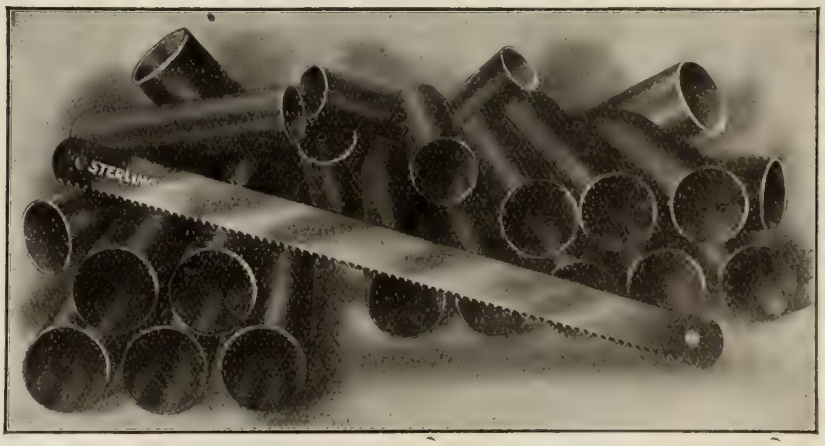
save time because they don't have to be stopped for filling, emptying or inspecting of the work. They save floor space, because they stand vertically and occupy little room—and they save money, because they require a smaller investment in barrels.

**Eight stock sizes, $50 to $170. Our Booklet 2 contains useful information on tumbling — shows the different styles of Globe Barrels and tells what each will do. Write for a free copy to-day.**

**The Globe Machine & Stamping Co.**
**Cleveland, Ohio, U. S. A.**

## "Sterling" Hack Saw Blades

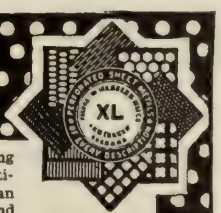
will prove an economical investment. Give them a trial and be convinced.



**DIAMOND SAW & STAMPING WORKS,**

**BUFFALO, N.Y. U.S.A.**

## PERFORATED METALS



Write to us regarding your Tool Room partition problems. We can save you space and light.

We make any size perforation in any kind of metal required.

**Canada Wire & Iron Goods Co., Hamilton**

We also manufacture
- Wire Cloth for all purposes
- Concrete Reinforcement
- Molders' Riddles and Bellows
- Metal Clothes Lockers
- Steel Factory Stools
- Window Guards
- Ornamental Wire and Iron Work

# CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS--Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5.00 per line a year is charged to non-advertisers.

## Sets a new high-mark for efficiency and economy

Main Spindle has taper journals which run in annular bearings.

Constant lubrication is assured by ring oilers which revolve with spindle and pump oil from reservoirs underneath bearings.

Thrust is taken on front bearing, and journals have independent adjustment in either bearing.

Feed Shaft is driven from spindle by heavy silent chain pro tected with complete guard, supplied with compression grease cup for lubricating chain and sprockets.

All Feeds positive driven through gearing, giving 18 changes.

Automatic Feeds can be operated simultaneously and reversed while machine is in motion.

Feed Gearing is Hardened and feeds have independent controls.

Vertical and Cross Feed Hand Wheels have concealed clutches in hubs which allow wheels to run free on shaft when not employed.

Dividing Head is cylindrical in pattern. Supporting Block for Spindle is carried by side plates which recess into block and have annular bearings in ring of main frame.

# Heat Treating Insurance

WHY NOT insure yourself against rejections of Shrapnel Shell? You may put this policy in force by permitting us to act as your Metallurgical Engineers.

We are saving money for several manufacturers of Shell, and are able to do the same for you. For a nominal consideration our corps of experts will organize and instruct your operators, and install a checking system which will enable you to be sure of your results before submitting Shell for tests.

**Ninety-eight per cent.** efficiency may sound high, but it is possible.

*Wire for our proposal.*

COLBURN

HEAVY DUTY

DRILL PRESS

This is the only kind of a machine capable of drilling Lyddite Shells at highest speed.
The great power, stiffness, rigidity and ease of operation of a Colburn results in exceptional production.
Its drilling capacity is limited only by the endurance of the drill.
Colburn service will prove a big asset to you if you have a contract for high explosive shells.
Built in several sizes.
Arranged for belt or motor drive.

*Write for details.*

COLBURN MACHINE TOOL CO.
FRANKLIN, PA.

The Ideal Machine for Drilling

Lyddite Shells

Used in United States and abroad in Ordnance Shops

# Why P. & W. Taps Win

## It's in the Design

One-third of the land from the cutting edge is concentric.

*The remaining two-thirds has eccentric relief.*

The taper-tap has a cylindrical pilot.

The taper- and plug-taps have an eccentrically relieved chamfer relieved clear from the cutting edge.

The highest grade of steel obtainable is used.

## What It Means to You

Taps can be sharpened at the only correct point—on the face of the cutting edge.

Sharpening in no way affects their size.

Can be sharpened long after other so-called eccentrically relieved taps are rendered useless.

We obtain the freest cutting tap with the longest life—an exclusive combination.

Accuracy nowhere else obtainable is secured together with a degree of finish and refinement heretofore thought impossible in a commercial tool.

For a number of years we have made taps with this style of relief. They have won out steadily and consistently on merit alone.

# THE PUBLISHERS' PAGE

by B. G. N.

# Important Announcement

## to our Subscribers and Advertisers

OUR ISSUE of April 29th will be a special number devoted to the manufacture of

## Shrapnel and Lyddite Shells

It will be the most complete and instructive work that has been published on this unusually interesting subject. For some time our editors have been almost exclusively engaged in gathering material, photographs and drawings in the most important Canadian Shell Manufacturing Shops. They have had the fullest co-operation on all sides, and a remarkable series of articles will be published in our

## Shell Number, April 29th

Widespread interest has already been displayed in our coming number, and orders for additional copies have been coming in every day since our first announcement was made.

In order to be able to supply the demand for extra copies it will be necessary for all orders to be in our hands by Monday, April 26th. Price, 25 cents per copy.

## To Our Advertisers

Many of our clients are going to take full advantage of the unusual interest that will be created by our Shell Number, and have arranged to use larger space than usual.

If *your* line is adapted for use in Shell Manufacturing, we certainly would advise you to carry a strong announcement in our next issue. Copy and cuts should be sent so as to reach us not later than Monday, April 26th.

CANADIAN MACHINERY
143-153 University Avenue
TORONTO

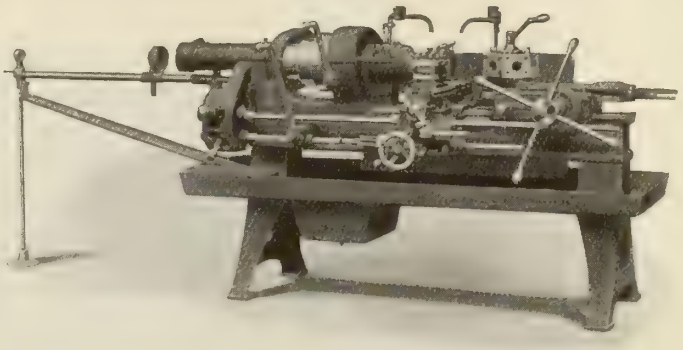
# For Bar Stock, Castings and Forgings

## The No. 4 Universal Turret Screw Machine is equally adaptable for bar and chucking work.

With the simultaneous power operation of both carriage and turret independent of each other, it is possible to conduct two distinct operations at one time, using as many as eleven tools at one set-up.

These features make this machine profitable for manufacturing in large quantities or for the production of a small number of interchangeable pieces.

Ask us to show the profitable application of this machine to your business. Write to-day.



No. 4 Universal Turret Screw Machine
With Bar Equipment

Bar Capacity, 1½" x 10".
Swing over Bed, 16".
Over Carriage Cross Slide, 8½".

*Complete Line of Turret Lathes, Turret Screw Machines and Brass-Working Machine Tools*

# Starrett "Mike" No. 3—The Pet of Many Good Machinists

Of all the tools and instruments used by machinists and toolmakers in thousands of shops all over the world, one tool stands out as the universal standard—the one-inch Starrett "Mike" No. 3.

Here's to it: It is the first fine tool you buy after you have the usual steel rule and calipers and dividers, when you are getting your trade—and later it is the standby in all your work. The ratchet stop, lock nut, and decimal equivalents make it all you desire. It's as good as new after years of service, because when the spindle wears even a fraction of a thousandth, you can take it up in a second by a slight turn of the sleeve with the little spanner wrench that came with the "mike."

The plush-lined leather case that may be had with the micrometer for fifty cents makes a fitting place to keep the micrometer after the day's work is done.

*A postal with your name and address will bring a free copy of our 320-page Starrett Catalog No. 203, which describes 2100 styles and sizes of fine tools.*

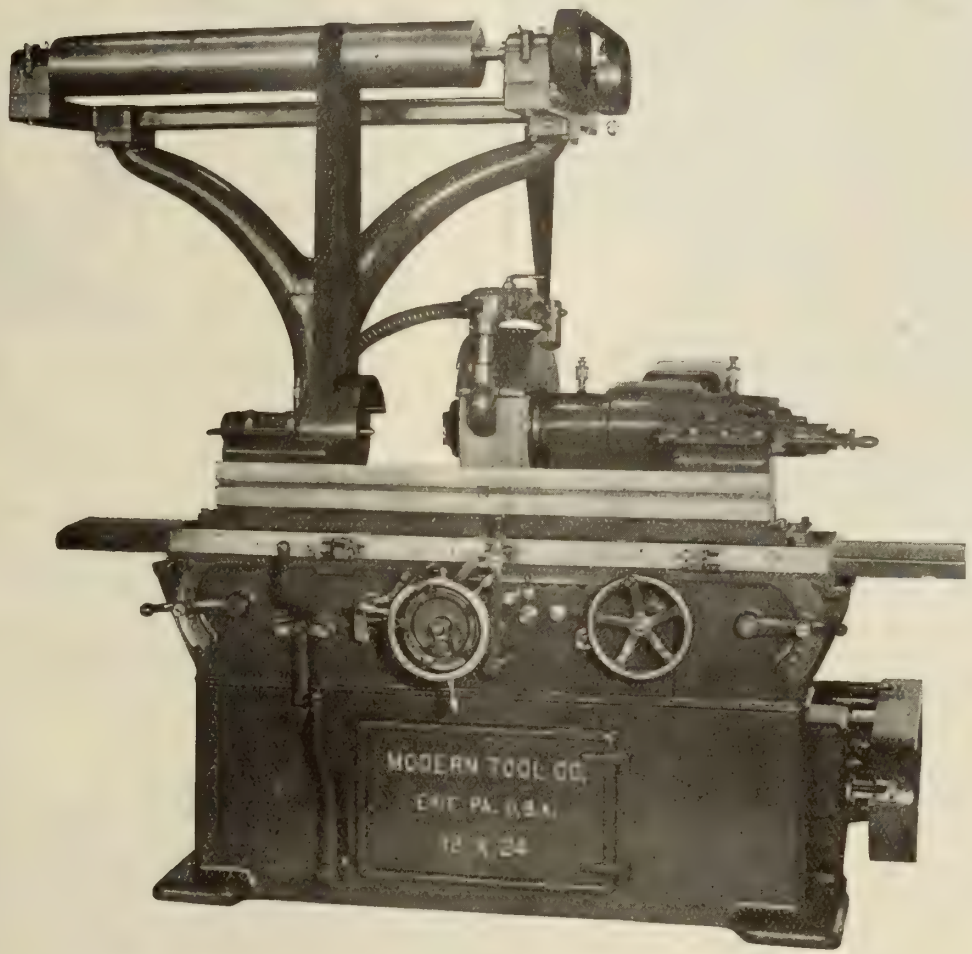
# Finishing Shrapnel Shells

ON THE

## "MODERN" 12" x 24" Self-Contained Grinding Machine



## The heaviest, most powerful and efficient Standard Grinding Machine made for Shell work

The "MODERN" 12" x 24" Grinding Machine is especially adapted for grinding Shrapnel Shells. The Machine is more than guaranteed, it is demonstrated. Large diameter, wide face wheel, with powerful drive—automatic feed without traversing the table—absolute central control of all levers and hand wheels—single constant speed drive.

We have recently sold a large number of these Machines in Canada, completely equipped for Shrapnel Work. Ask the man who is using the "MODERN."

The large manufacturer appreciates the production possible on this Machine. Machine comes equipped for all classes of straight and taper cylindrical work.

## How Much Use Do You Make of Expert Demonstrators?

Many a manufacturer could get better production if he would utilize the expert knowledge and broad experience of the demonstrators of

## Norton Grinding Wheels

A large producer of malleable castings made an interesting test with his own workmen at the suggestion of a Norton salesman. He was using Norton Alundum Grinding Wheels and was well satisfied. But grinding wheels are being made more efficient every year and our stock of knowledge of how to increase the production in grinding operations is steadily growing.

The method of test was this:

One stock wheel and one trial wheel were put on the same spindle of a floor stand so that both ran at the same speed. The two men working on these wheels ground castings from the same pile and changed daily from one wheel to the other. Below is shown the comparative results:

| | Stock Alundum Wheel | Trial Alundum Wheel |
|---|---|---|
| Lbs. ground per hour..... | 309 | 315 |
| Average cost of wheel per ton of castings ground ..... | $0.45 | $0.352 |
| Average of wheel wear per ton of castings ground ..... | 34.98 cu. in. | 27.40 cu. in. |

This gain in production and decrease in wheel cost was the result of a more intensive study of the operation and the selection of a wheel better suited to the job. It needs only a word from you to secure from us the same kind of co-operation.

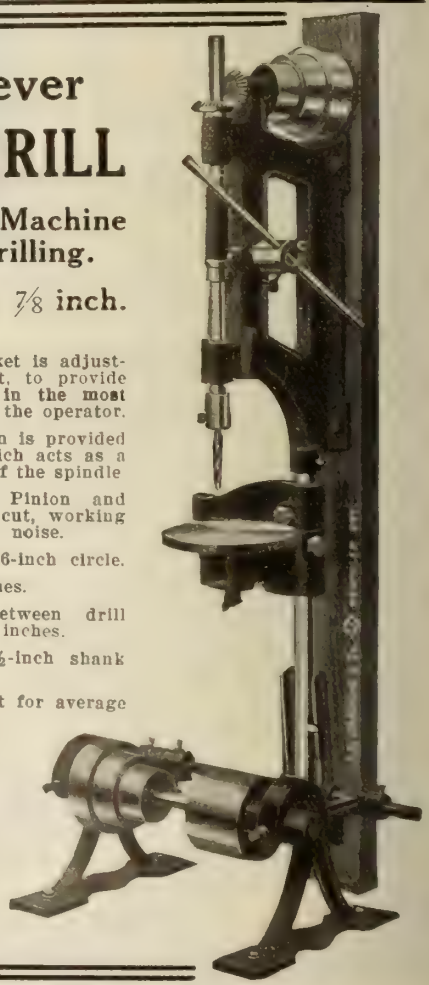
## 16 in. Lever POST DRILL

**A Giant Little Machine For Light Drilling.**

**Will drill up to ⅞ inch.**



The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16-inch circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½-inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

**A. B. Jardine & Co.**
Hespeler, Ontario

# Artificial Lighting in Relation to Manufacturing*

By G. H. Stickney**

*Not one of the least prominent features of the "Safety First" movement is that relating to the improvement of the natural and artificial lighting of our workshops and factories. In the accompanying article, the more important considerations to be accounted in the matter of artificial illumination are exhaustively discussed from a variety viewpoint.*

WHILE a very conspicuous advance in lighting methods has been made by progressive manufacturers, notably in the iron and steel industry, there are still a large number of manufacturers who seem to regard the lighting as an expense to be reduced to the lowest possible minimum.

The increased appreciation of daylight is indicated by the modern type of building construction, in which the light-finished, high studded workroom, with large window areas, often equipped with diffusing glass, and sometimes supplemented with saw-tooth roofs, permits the fullest possible utilization of natural light.

### Artificial Lighting Progress.

It is in the artificial lighting, however, that the greatest progress has been made. The wonderful developments in high efficiency units have greatly enlarged the possibilities of factory lighting during the hours of diminishing daylight and darkness, or in places where daylight cannot penetrate; so that now a proper lighting installation is not only an important safeguard, but an actual economy. Manufacturers who are to-day securing poor illumination with older form of illuminants, can, by a revision of their lighting equipment, procure a good illumination, not only without much additional cost, but in many cases with an actual reduction in the operating cost.

### Economic Value of Good Lighting.

The economic value of good illumination, aside from accident prevention, is evident when we consider the greater facility with which an employee can work under good illumination, and the greater accuracy with which gauges can be read and tools set. One large manufacturer, on investigating his lighting conditions, found certain departments in which, during the winter months, the operatives were practically idle for about an hour a day solely on account of darkness.

Good artificial illumination can be furnished in such a factory for eight hours a day at a cost equivalent to about five minutes of the time of the workmen benefited. This illustrates the extravagance of poor lighting. For a great variety of conditions, good illumination reduces the manufacturing costs by increasing production, raising the quality of workmanship and reducing the number of defective parts and "seconds."

### Safety Feature.

The question of safety as influenced by illumination presents two phases:—First, the prevention of accidents; and second, the preservation of eyesight. While these two phases are often closely related, there are many conditions in which they are entirely independent of each other. The phase of accident prevention is illustrated in the case of the foundry or other shop where cranes or other powerful machinery are in operation. The liability of crane and elevator accidents is very much reduced with proper lighting.

In the foundries and yards of a plant, is is practically impossible, even with safety committee inspection, to eliminate irregularities under foot. If not illuminated these may readily cause falls, with resulting injuries; and in foundries where molten metal is carried and hot metal abounds, they may often cause serious burns.

Again, even though guarded to the fullest extent, powerful machinery—in which materials are machined and fashioned into articles of commerce, and in which the arms and limbs are as readily crushed—presents a menace unless the operatives are given an opportunity to see and thus avoid the danger points.

### Eyesight Preservation Feature.

Although the blind are trained to do remarkable work in certain lines, there is practically no manufacturing operation in which a blind person is not at a disadvantage, while there are so many which cannot be carried on without accurate visual inspection. Some of these operations produce considerable strain even under good illumination, and to require their performance under poor illumination is certain to result in more or less rapid impairment of vision. While economy should in all cases require the best lighting practice, humanity demands it.

### Defining Good Lighting.

In view of the preceding, one might very properly ask: "What is good illumination?" and judging from some of the attempts that have been made to solve lighting problems, the conclusion might be drawn that simply a higher intensity of light is the answer. Undoubtedly a higher intensity of illumination is needed in most workrooms, but there are other features of equal and sometimes greater importance. The minimum intensity acceptable generally depends upon the reflecting power of the surfaces to be seen, the fineness of the detail to be observed, the time of observation and the closeness of application. Unless glare be introduced, a higher intensity of light is rarely objectionable, except from the standpoint of cost.

Owing to the remarkable adaptability of our eyes, we are able to get along satisfactorily with very much lower intensities of artificial light than are usual with natural light, and perhaps the best way to consider the other features of good illumination will be to point out some of the most common shortcomings found in factory lighting.

### Factory Lighting Defects—Glare.

From my own observations, the most common defect is excessive glare and absense of diffusion. Glare is usually caused by bright lights in the field of vision. This may emanate directly from the light source or may be reflected by a glossy surface: it can also be caused wherever excessive contrast of intensity appears in adjacent fields of vision. The dazzling effect is not only unpleasant, but interferes with seeing. Under continued exposure, eye strain and even permanent injury to the eye may result.

The unshielded light hung over a machine is a common source of eye fatigue. The glare may not be very evident at first glance, but when the workman's eyes have been subjected to such light for a long time, discomfort and inability to see result. The workman frequently complains of insufficient light when in reality the intensity may be higher than is required for the work. In case an attempt is made to meet the complaint by installing a larger light, the workman's eyes are subjected to a still more severe strain. The proper correction should be to shield the light by means of a proper reflector, and as such a reflector would tend to direct more of the light upon the work, the working intensity would be increased; so in many cases it is possible to reduce the size of the lamp, or better yet, to relocate the

*From a paper presented before the American Museum of Safety.

**Edison Lamp Works, Harrison, N.J.

lamp so as to enlarge the area illuminated.

When a light cannot be removed entirely from the field of vision, its brilliancy should be reduced by means of a diffusing globe or reflector, so as to increase the apparent size of the light source and reduce the contrast between it and the background. This has the additional advantage of reducing the sharpness of shadows in the illumination, a result which is of considerable importance in rendering the various parts of a machine or other object readily discernible.

Glare received from specular reflection of glazed paper, desk tops, polished metal, etc., often induces eye trouble, headache, and other indispositions; though the sufferers may not be aware of the cause. The remedy is to change the relative positions, so that the reflected light is kept out of the eyes as much as possible, and to enlarge the dimensions of the light source, as already mentioned.

**Improper Light Distribution.**

Another defect commonly found in industrial lighting is improper distribution. This may be due to too wide a spacing of lighting units. Under this condition some parts of the room are insufficiently lighted while other parts may have more light than is necessary. Improper direction of light may illuminate the wrong side of the machine, leaving the important parts in shadow. If the bright parts are near the shaded ones whatever illumination may fall upon the shaded portion is rendered less effective by contrast. Unsteady or flickering illumination is always objectionable; both on account of discomfort and the inability to see. Such variation should always be avoided, whether caused by the units themselves or by the light passing through moving wheels, etc.

Since the purpose of the lighting is to enable the operative to see, good illumination can not be prescribed until we have some knowledge of the use to which it is to be put. In order to plan the lighting of a factory properly, one should be familiar with the processes employed, the arrangement of the machinery and the work tables, as well as the quality of the product manufactured. Practice has established certain methods of lighting which, if properly applied, are satisfactory for the different processes of manufacture. Thus, we know approximately how much illumination is necessary for the ordinary grade of work as performed on a lathe, as well as the direction desirable. As far as possible, therefore, the experience gained in well-lighted factories should be utilized in planning the lighting installation.

Where extensive lighting problems are to be solved, it is advisable to retain a competent engineer with illuminating engineering experience. However, the following comments on various methods of factory lighting will give some idea of the general practice. Factory lighting has developed along a few fairly definite lines, which may be designated as localized lighting, general lighting, combined general and localized lighting and localized general or group lighting.

**Localized Lighting.**

Localized lighting originated with the low power portable or semi-portable lighting units. These were under the control of the individual workman, to be placed or shifted wherever he desired. Such lamps were commonly used without reflectors and produced small patches of uneven illumination, as well as more or less glare. In many cases lighting with these lamps is now being supplanted by other methods, on account of the following disadvantages. Lamp breakage is likely to be high, and the expense for installing, energy supply and maintenance excessive, depending upon the conditions and arrangement of work. Moreover, the attention of the workman is called to the lighting and much time is often lost from his regular work in adjusting the lamp.

There are, however, certain operations which require light inside of a small cylinder or other enclosed space; or where very high intensities are required over small areas, and for these no other method is as practicable as localized lighting. For such conditions, the lamp should be equipped with a reflector to shield the workman's eyes and reflect the light in useful directions.

**General Lighting.**

General lighting came into common practice with high power lamps. Since with these units economy makes a wide spacing necessary, the best method of applying is to equip them with diffusing globes and reflectors, so arranged as to distribute the illumination as evenly as possible. Lamps are hung high, in proportion to their power and the intensity required, and equally spaced throughout the room. The ideal sought is equal intensity over the entire area.

General lighting is provided in three principal ways, which are known as direct, indirect and semi-indirect lighting. With direct lighting, the larger part of the light is distributed directly from the lighting unit to the surfaces to be lighted. With indirect lighting, the light source is concealed and the light thrown upon the ceiling or wall and thence re-distributed for use. With the semi-indirect lighting, the light source is shaded by a translucent reflector and the larger part of the light thrown upon the ceiling or walls for redistribution. Direct lighting, depending upon the equipment, may have excessive brilliancy or any degree of diffusion. It is used to a much larger extent in factory lighting because factory ceilings are seldom good reflectors. Direct lighting units are less affected by dust accumulations. The indirect and semi-indirect give excellent diffusion, and are often applied with good effect in offices and drafting rooms when light ceilings are available.

**Combined General and Localized Lighting.**

Combined general and localized lighting is often desirable. With this, a low general illumination is supplied by large units and more intense localized illumination at particular points by low power units. The localized lighting may be supplied continuously or temporarily as needed. For example, in lighting automatic machinery, a moderate illumination may be sufficient at all times except a machine is being inspected, set up or adjusted, when a localized light may be needed for the particular machine.

**Localized General or Group Lighting.**

Localized general or group lighting is a recent practice which has sprung up since a range of intermediate sizes of lighting units has become available. This practice differs from general lighting in that, instead of striving for even intensity throughout the room, lamps are arranged to give higher intensities and correct direction of light at the machines or tables and a lower intensity at intermediate points. It differs from localized lighting in being planned so as to give some illumination, sufficient for the needs, in all parts of the room. It is, therefore, an intermediate practice between the extremes of localized and general lighting. Its application is extending very rapidly, since it meets effectively and economically factory requirements for a large portion of the ordinary processes and buildings.

Each of these various methods of lighting has some field in which it is to be preferred to any of the others, and the selection depends upon the character and construction of the building, the process of manufacture, the source of energy available and various local conditions.

That the progress in good factory lighting will be even more rapid in the future seems unquestionable.

While good factory lighting is likely to be made compulsory by law, it is hoped that the manufacturers will be sufficiently awake to their own interests to take any necessary steps of their own initiative rather than through compulsion.

# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## TURRET LATHE AND VERTICAL BORING MILL PRACTICE.—VI.

By Albert A. Dowd.

IN our March 11 issue the operations of machining a plain clutch flywheel were illustrated and described, and in the present instance the operations relative to the machining of a cone clutch type flywheel are the feature.

### Machining a Cone Clutch Type Fly Wheel.

The fly wheel shown at A in Fig. 6 is perhaps the most common type of automobile clutch fly wheel, and the method of handling it is applicable, with slight variations in the tooling, to a majority

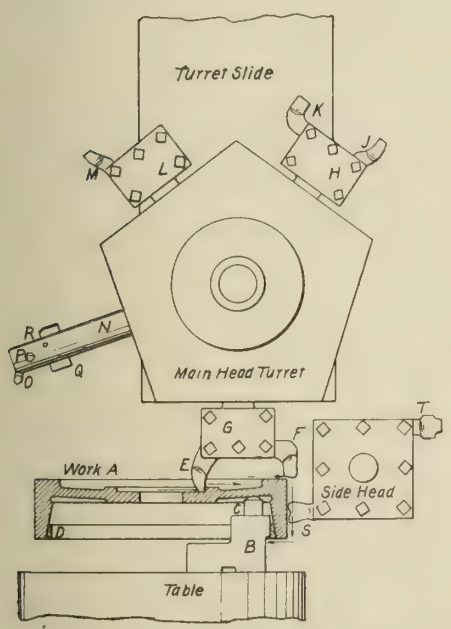

FIG. 6. TOOL LAYOUT, FIRST SETTING.

of the designs of the cone clutch type of wheel. Now, as it is essential that the shouldered portion and the clutch taper be in perfect concentricity one with the other, and as it is difficult to hold the piece by a machined taper surface for the second setting, it follows that the shouldered portion should be machined in the first setting and that this shoulder must be the locating surface from which the taper is machined in the second setting. It will be seen by a reference to the illustration that it would be out of the question to attempt to hold the work by the rough tapered clutch surface, as the angle of the taper would not permit a secure grip on the casting. It becomes necessary, therefore, to add to the pattern an annular chucking ring D, by which the work can be gripped and firmly held.

Having thus provided for the holding, the work is placed over the jaws B, with the web resting on the three buttons or pins C in the upper part of the jaws, the latter being slightly relieved on their faces in order to permit undercutting the rim. As in the previous instance the tooling is quite simple, forged tools being used throughout with the exception of the boring and reaming bar. In the first operation a standard tool holder G is furnished with two special forged tools E and F, which are so spaced as to permit the roughing out of the shouldered portion and the rough facing of the rim simultaneously. The turret is then raised slightly and the tool E used to face the hub. While these cuts are being taken by the main head, the tool S in the slide head rough turns the periphery and undercuts the rim of the wheel.

Both the main and side head turrets are now indexed and the tools J and K used in the tool holder H to complete the finishing of the same interior surfaces as those previously roughed in the first operation, a few thousandths being left at the shoulder for the final sizing cut. The tool T in the side head is used for the exterior finishing, being operated simultaneously with the other tools. It will be noted that the side head tool is so made that it can be utilized for rounding the corners of the rim as well as the finish turning and undercutting.

The third operation is that of sizing the shoulder with the tool M in the tool holder L, this tool being offset an amount sufficient to give the correct diameter when the main head is operating at the centre stop, thus obtaining the size very accurately without resorting to anything very special to accomplish the result.

The fourth and final operation is that of rough and finish boring and reaming the hole with the bar N. This bar is of similar construction to that previously described, having a roughing tool O, a finishing tool P, and a flat floating reaming cutter Q, which is prevented from falling out by the pin R.

This method of handling a clutch fly wheel is both rapid and economical with respect to the tooling, and adaptations of the layout may be readily made to suit a variety of conditions for work of this order.

### Second Setting.

A fixture B is shown in Fig. 7, which is utilized for holding the work during the second setting, the fixture being located on the table by the centering plug D, and held down firmly by three bolts G, which enter the table tee-slots. The finished shoulder of the fly wheel is located on the upper portion of the centreing stud at C, and is clamped down on the fixture by means of the straps E and the screw studs F. A refinement which can be introduced in the locating arrangement is the substitution of a hardened and ground locating ring for the unhardened plug shown in the illustration. This ring can be forced on to the large end of the stud, and will stand the wear and tear better than the plain stud,

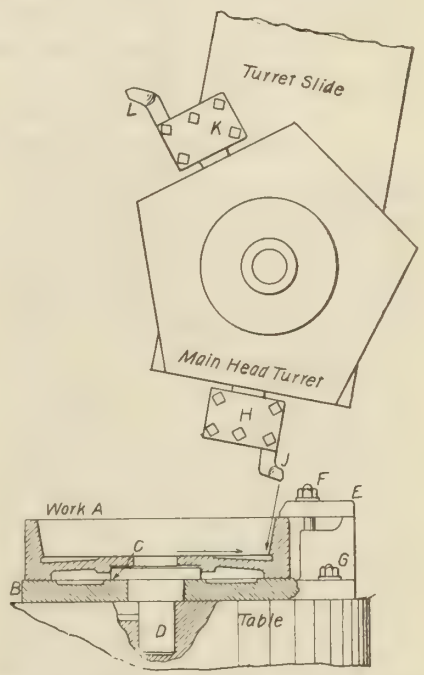

FIG. 7. TOOL LAYOUT, SECOND SETTING.

and in addition to this point, replacements may be easily made.

The only work to be done in this setting is that of facing the hub and machining the clutch taper, and as this type of machine has a swivel head, this is set over as shown to the required taper and left set during all the operations required in this setting. The tool J is held in a regular tool holder H, and is fed down to rough out the taper after which the main head is moved over to the centre and the hub is faced with the same tool, using the transverse feed. For the second operation, the turret is indexed so that the tool L in the holder K is utilized for the finishing, in exactly the same manner as the roughing tools.

It will be noted that the method of

handling illustrated gives perfect concentricity of shoulder and clutch taper, which is the important point for work of this character.

## CONTINUOUS MILLING.

By D. O. McDonald.

CONTINUOUS milling is usually associated with the vertical type of milling machine and a rotary positively driven table. This means, of course, that the operation is limited to rather small pieces, as otherwise the rotary table would be too large for the regular machine table. There are, however, many examples of milling machine work, which by proper manipulation may be made practically continuous, using the regular type of machine.

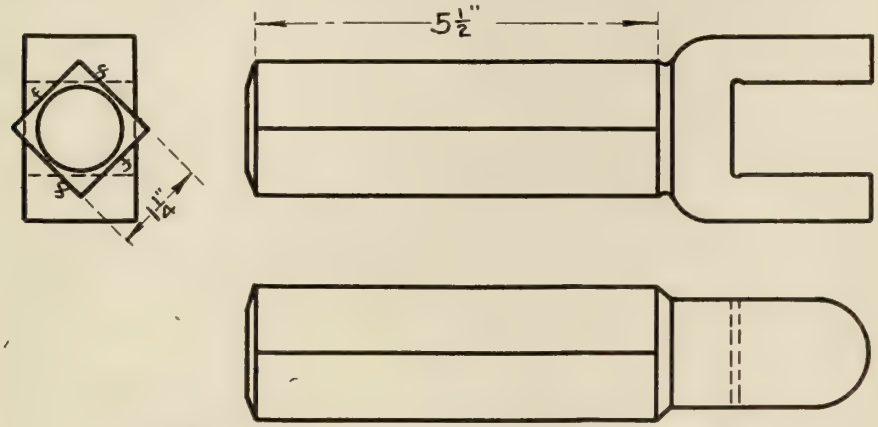

FIG. 1. CAM ROLLER SLIDE FOR STATIONARY GASOLINE

The piece shown in Fig. 1 is a cam roller slide used on a stationary gasoline engine. The stem of this piece is finished on all four sides, the fixture for holding while the milling operation is performed being shown in Fig. 2. The pieces are set on end, being pushed back in the fixture and held by two clamping bolts, which are located at an angle of 30°. As these are drawn up, the head of the bolt serves to clamp the piece in the two directions. The fixture was made of sufficient length to accommodate eleven pieces, and it will be noted that the upper clamping bolt is somewhat shorter than the lower, thus affording clearance for the wrench when tightening same. The openings into which the castings are placed are relieved in the centre and at the bottom, so that there are but two bearing points directly opposite the heads of the bolts. A six-inch face mill was used for milling the sides of these pieces.

The method of operation was to fill the first opening in the fixture and start the feed, the table having been set the proper distance from the cutter, allowing, of course, for the finish on the opposite side. As the feeding proceeded, the operator loaded the remaining positions of the fixture, and then proceeded to take out those that had passed the cutter. The table was then run back by hand with the fixture entirely empty. Pieces were then turned 90° and the entire lot finished on the two sides. After being half completed in this manner, the table was moved up to the cutter so as to give the proper finished thickness, after which the other two sides were completed.

A great deal of time, however, was lost in running the table back and inserting the first piece, the cutter being idle during this entire time. The method adopted later consisted in loading the fixture as before, and as soon as each piece was past the cutter to turn them one-quarter way round and reclamp. When the cutter reached the end, however, it was allowed to run over the last piece sufficient to just clear the one before, so that it could be turned. As soon as this was done, the feed was reversed, and the cutting proceeded as before, only in the opposite direction, the operator stepping to the other side of the table and removing the pieces and inserting new ones. In this manner the cutting was practically continuous, the only time wasted being that necessary for the cutter to run over the last piece sufficiently to clear the one before.

It will be seen that the number of pieces milled per cut is one less than the number which the jig holds. The gain in production in this manner was about 60 per cent. over the previous method, and while the operator was kept on the jump most of the time, yet he did not have to run the heavy table back and forth, so that the work was not as tiresome as formerly.

This method of practically continuous milling can be applied to many other jobs on which a face mill is used. Of course, in the one direction there is a tendency for the cutter to lift the table, but where a heavy machine is used and the fixtures are firmly clamped down, this is no disadvantage. Of course, the method is only applicable to the face mill, as this does not tend to hog-in in either direction.

Where it is possible to use this method, the fixtures need not be any way elaborate. The production is practically equal to that of any other arrangement for strictly continuous milling.

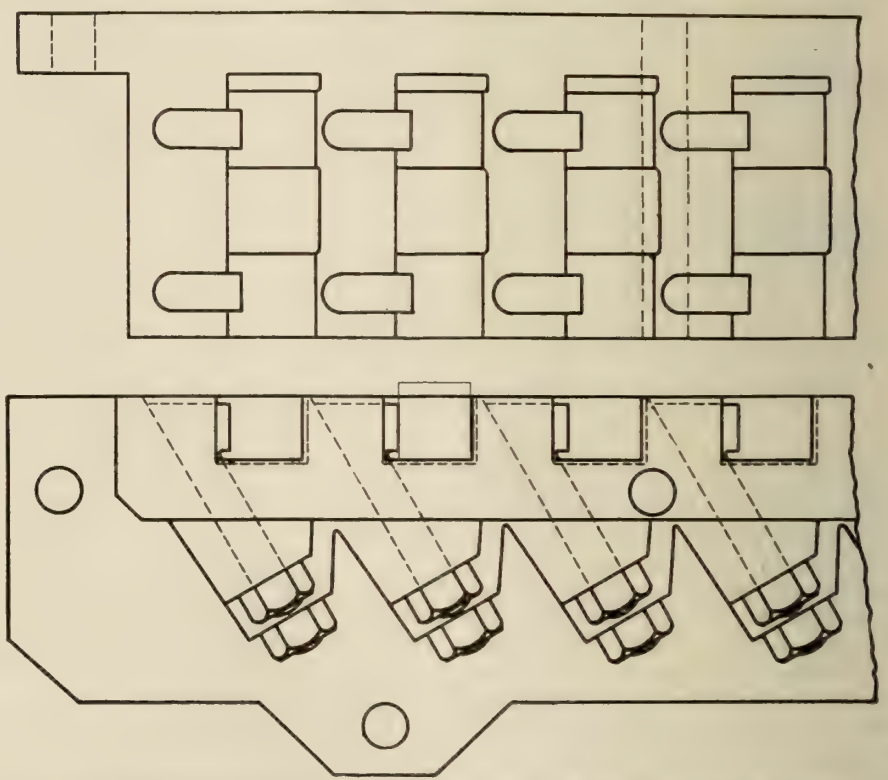

FIG. 2. CONTINUOUS MILLING CAM ROLLER SLIDES FOR GASOLINE ENGINES.

## CUPOLA DEVELOPMENT AND OPERATION.

By R. Buchanan.

WITH respect to those types of furnace which were drawn in at the bottom, I have made up my mind that this feature was an advantage, and have often debated whether the saving of coke effected was not more than counterbalanced by the cost of the extra labor required in fettling, to say nothing of the risk of hanging up just where the contraction of the contour started.

### Receiver Feature.

With regard to having a receiver, opinion among foundrymen is very varied. To my mind the question whether or not a cupola should have a receiver depends largely upon the class of work to be done. A founder who was casting very large cylinders told me that he had worked a furnace without a receiver, but having tried a receiver he would not now do without it. One obvious advantage of a receiver was that a foundry with a particularly small output, but with occasionally a large casting and requiring very clean work, could gather the metal and so utilize the small cupola with advantage in making the large casting. There was thus avoided the necessity of having two cupolas, one of which would be most of the time standing idle. That consideration, to my mind, covered the question, though it is also to be noted that, with a receiver, one can have the tuyeres nearer the bottom than if the metal had to be gathered in the cupola itself. It should, however, be borne in mind that with a receiver more work was required to get the complete apparatus ready for melting than was necessary when there was no receiver.

In the Machiel cupola the receiver was really the bottom part of the cupola. There was a bridge extending over four-fifths of the bottom, and everything was kept up by that bridge. The metal when melted remained in the receiver and was gathered there. I prefer that cupola, as it is possible to get exceedingly hot metal with a comparatively very small expenditure of coke; but the coke and the debris has to be drawn out at the end of the cast, whereas in drop-bottom types the bottom can be dropped, and the cleaning out takes very little time. The Whiting cupola has two rows of tuyeres, whereas the Thwaites has three. The tuyeres in the Whiting are made adjustable, but my experience of adjustable tuyeres is that if we work for a time with one row only and then try to use the second row, they can not be got open.

I consider it an advantage to have a second row, but only big enough to supply sufficient air to burn the gases which were formed below. This is better than letting the gases go up and burn by admitting air at the charging door. The latter was quite a common practice at some foundries, but when one saw a flame 9 or 10 ft. long coming out at the top of a cupola the inference was that the owner either had a lot of money to burn or did not know how to run a furnace. The second row of tuyeres should serve to burn the gases, but not to burn the coke, though it is probable that some of the coke also would be burned.

As far as I know, there is no melting in the cupola now done by gas. In experimenting with the latter some years ago, the ash-bed was filled up with coke and instead of pure air a mixture of gas and air was played on to the bed. I melted 2,800 lbs. practically without wastage of the coke; the cupola melted slowly, but hot, and I took out practically as much coke as I put in. That, of course, was not melting altogether by gas, because a bed of coke was used.

### Contour of Linings.

There are many different opinions as to the best form. The tendency is towards a perfectly vertical section, the cylindrical form. One often wishes that we could get the linings of cupolas to last as long as did those of blast furnaces. I have seen a blast furnace which ran for eleven years without relining, but in the more modern blast furnace they are going back more to the type of the cupola. There was no doubt that in a wide blast furnace carbon was deposited on the walls and so preserved them, whereas in a blast furnace of the cupola type no carbon was deposited on the walls.

I had seen only one water-cooled cupola, that in a steel works, and the wastage of the lining there amounted from 12 in. to 15 in. in a week, so that each week the lining, from the melting zone up to the charging door, had to be renewed. In the ordinary cupola frequent renewals are, of course, necessary, but it does not seem that it should be an absolute impossibility to design a cupola, the lining of which would last at least a week without requiring any renewal.

### Blast Pressure.

With regard to blast pressure, it has been shown that as the blast is increased the hardness increased. A few years ago it was pretty generally thought that the more air was blown in the better; but that idea was wrong. One foundryman known to me used a 22-oz. blast, his object being to get a very close-grained metal, but in such a case it would be better to select a different metal to begin with and use an easier blast instead of using a soft iron and then hardening it by heavy blowing. On the other hand, another foundry used 1,700 lbs. of scrap to 560 lbs. of pig, and the castings came out quite soft, a 4-oz. or 5-oz. blast being used. That foundry was, in fact, buying coke instead of pig-iron.—From a recent address before the Birmingham Branch of the British Foundrymen's Association.

## DOMINION SHELL COMMITTEE REPORT.

A REPORT on the work of the Shell Committee appointed by the Minister of Militia last fall to supervise the manufacture of shells and explosives used in war munitions has been made to the Government. The head of the committee is Col. A. Bertram, and the chief technical adviser is David Carnegie.

The report reviews the committee's work in securing orders for the manufacture of shells in Canada, aggregating up to the present time, it is understood, some $80,000,000, and embracing factories in all parts of Canada. Arrangements are being made at a number of western points to start the manufacture of shells.

The committee reports that all the material being used in the manufacture of shells is, with the exception of copper, being mixed and smelted in Canada. These materials include the shell cases. brass cartridge cases, primers, cordite, powder, and fuses. Thousands of men who would otherwise be out of work are now employed in the various manufacturing processes.

Nearly two hundred examiners and district inspectors have been appointed, under the direction of the Chief Inspector of Arms and Ammunition, to see that the work is being properly done in each factory. Uniform prices are paid, and arrangements have been made to supply the shell-assembling manufacturers with all the component parts of shells free of charge. All kinds of shells up to the eighteen-pounder shrapnel shells are being manufactured.

The committee is now working on investigations in connection with the supply in Canada for the War Office of propellants and high explosives, and also the possibility of filling orders from the Russian Government for rifles and ammunition.

In addition to the manufacture of several thousand tons of cordite and powder in connection with the recent contracts for shells, there is to be noted the utilization of the by-products from the coke ovens of the Dominion Iron & Steel Co. at Sydney, N.S., for the manufacture of the high explosive trinitrotoluene.

The report concludes with the statement that the quality and finish of the shells made in the Dominion are at least equal to those of British manufacture.

## DISEASES OF METALS.

By R. Micks.

THAT certain metals are subject to disease under certain conditions may sound strange to many people, but men who have spent most of their lives in their study will tell you that it is an actual fact that metals become tired and have fatal diseases.

Take the malleable foundry, for instance, in plants where light work is made. There is always an excess of sprues and other hard scrap, and this is melted over and over until it becomes tired or dead, and, therefore, impossible to run light castings with it.

Of course, there is a remedy for this trouble, as the addition of high silicon pig or ferro-silicon in the mixture will bring the metal back to almost its normal state.

There are, however, some metal diseases whose cause and cure science has not yet diagnosed. One of these diseases attacks tin or hard solder having a high percentage of tin in its composition. It is a special disease of cold weather and proves very destructive at about 54 degrees below zero, as parties who have visited the Arctic and Antarctic regions can abundantly testify. It is even more destructive at a still lower temperature. This disease was the cause of Capt. Scott losing part of his gasoline supply in his Antarctic expedition. It seems to affect tin only, slowly changing it into allotropic form as tin powder.

Another one of these freak diseases broke out in a French military store house among the helmets and other articles, which were made of an alloy of copper and aluminum. It first showed up as spots of a light grey color and spread very rapidly. Under the influence of this disease, the metals composing the alloy are changed in proportion to nature, forming a bronze of aluminum. Little holes afterwards appear, and in a short time the object affected falls into complete decay.

Men of science have devoted much time and study to these diseases, but so far have not been successful in either discovering the cause or remedy.

## NICKEL AND ALUMINUM.

By E. V. Pannell.*

IT is seldom that we are at variance with the views of your journal, but our attention has been called particularly to the statements of your contributor on page 266 of a recent issue. In making certain claims on behalf of nickel, he draws an invidious comparison with aluminum, involving a number of misstatements regarding the latter metal.

In the first place, aluminum when manufactured in the form of cooking vessels is not a soft metal, except in relation to steel and the hard bronzes.

Secondly, the oxide coating on such vessels is an enamel-like film, hard, stable and neutral, and should not be scoured under any circumstances.

In reference to burning, a very light aluminum vessel on a very hot fire might melt if kept empty. We have never heard in all our experience of any aluminum utensils melting under practical conditions. The statement that aluminum is dissolved in liquid food and forms poisonous metallic salts, we can absolutely deny, and we have ample evidence of tests which have been conducted refuting this contention.

While admitting the wonderful progress made in nickel refining and the wide field opened to this metal, we are inclined to doubt the advisability of employing it in any direction where it is only replacing equally good and cheaper materials. The market price of nickel to-day is 45c and that of aluminum 20c. The lighter metal is, however, only one-third the weight of nickel, so that nickel is just about seven and a half times more costly than aluminum in any manufactured form.

The economy and efficiency of the light metal has already been widely recognized by military authorities in their specifications for canteens and water bottles for which aluminum is now being quite generally employed.

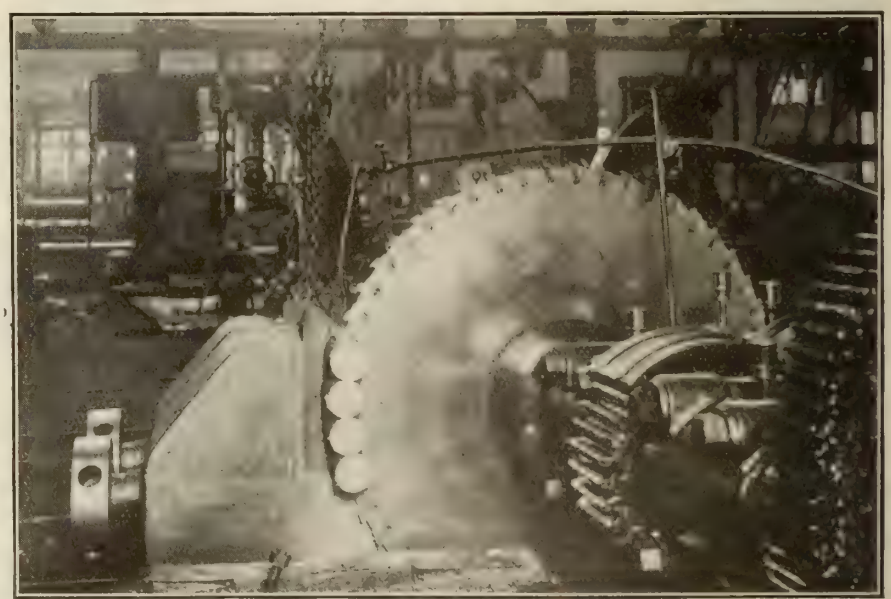
*British Aluminum Co., Toronto.

## A TRICK IN FIRE APPARATUS WORK.

By D. A. Hampson.

PROBABLY everyone who has observed fire apparatus has admired the finish of chemical tanks, particularly the highly polished or nickeled heads of such as are pebble finished. Few, however, know that there is utility as well as art in a head so made and that the work is all done by hand.

Chemical tanks are called upon to withstand considerable pressure and flat heads would bulge unless heavily braced, hence they are made of concave form. The head is formed up of heavy copper, and the pebbled or hammered finish is done with a special pein hammer by a skilled workman, who sits before a low anvil on which the head is laid. The anvil is made with a round top, very nearly fitting the head to be pebbled. A single blow forms each indentation. In the work the eye is the only guide a good man needs, and it is rare indeed



INSERTED TOOTH COLD BAR SAW WITH OUTPUT OF 80—3½ IN. DIA. BY 4½ IN. LONG SHRAPNEL SHELL BILLETS PER HOUR OPERATING IN A CANADIAN PLANT.

for him to make a miss. No pattern is used, and a small head is finished in an hour's time.

The hammer blows also have the very desirable effect of stiffening the head by hardening the copper and making it more dense. Manufacturers regularly furnish tanks with hammered heads at the same price as plain heads, though the cost to them is greater.

### STANDARDIZATION OF THERMOMETERS AND PYROMETERS.

IN a communication on the Institution of Mechanical Engineers, R. G. Whipple states that the question of standardization is of great importance to all users of thermometers, whether they are employed to measure high or low temperatures.

The boiling points of aniline, 184.1 deg. C.; naphthalene, 218.0 deg. C.; benzophenone, 306.0 deg. C., may all be used for standardization points. Aniline, however, oxidizes readily. Naphthalene is satisfactory, as it is cheap and readily obtained of sufficient purity. This is best tested by taking its freezing-point, which should be 80.0 deg. C. A special, but simple, boiling-point apparatus must be used with both naphthalene and benzophenone. For higher temperatures, it is advisable to use the melting-points of pure metals or eutectic alloys and the freezing-points of pure salts. The following will be found useful and satisfactory points:

Freezing-point of tin, 231.92 deg. C.
Freezing-point of lead, 327.43 deg. C.
Freezing-point of zinc, 419.37 deg. C.
Boiling-point of sulphur, 444.70 deg. C.
Melting-point of antimony, 630.7 deg. C.
Melting-point of sodium chloride, 800 deg. C.
Melting-point of silver, 960.88 deg. C.
Melting-point of copper, 1083.0 deg. C.

In the case of radiation and optical pyrometers, the best way is to sight upon a piece of firebrick or porcelain placed in either a small tube electric furnace or gas-fired muffle. A stardardized thermo-electric couple is mounted either on the face of the firebrick or through a hole in its centre, the pyrometer being focused on the couple. The furnace is then heated and the readings of the pyrometer compared at various temperatures. If a thermo-couple is not available, a single melting-point will be a valuable check on the pyrometer. A triangle is cut out of a piece of thin sheet silver, and one side partly folded over so that the sample will stand up when placed in the furnace. The pyrometer is then focussed on the tip of the triangle, and the temperature at which it melts (960.88 deg. C.) observed.

# Question and Answer Series for Foundrymen

*Foundrymen having difficulties in connection with their work are invited to forward particulars of them to this department for solution. The greatest possible care will be taken to give only reliable and tried-out advice on all questions and problems submitted for solution.*

**Question.**—What effect does manganese have on babbitt metal? We wish to make a manganese babbitt that will be somewhat similar to the well-known nickel babbitt.

**Answer.**—Manganese cannot be used to advantage in babbitt metals, as it is so strongly oxidizable as to make the alloy mushy. The addition of less than 1 per cent. of manganese-copper to a tin bronze will convert 25 per cent. of this alloy to a thick slate-colored mush, which shows a purple and gold coloring on top after being plastered into ingot moulds. A few pounds of this mush added to 500 lbs. of melted genuine babbitt metal will cause the ingots to surface ozidize at a low temperature. It can then be poured cool and will assume the rich gold coloring preferred by some makers of babbitt on their ingot metal.

* * *

**Question.**—We are making yellow brass castings, and have considerable trouble in getting a good color, also in getting them to run sharp. We are using a commercial yellow brass ingot, we watch the metal and temperature as closely as possible, and pour as soon as ready. With all these precautions the castings are rough and curly on the outside. We have tried a little aluminum, but this interferes with dipping, as the acid does not seem to touch the aluminum. We make lots of red brass and have no trouble with it.

**Answer.**—Have your chemist give you an analysis of your yellow brass ingot, and I think you will find it is either high in iron or very low in tin. This will explain your curly castings and their lack of color. You might also try skin drying your moulds, as this is also a big help when yellow brass runs curly.

* * *

**Question.**—Will you kindly tell us what you consider the best material for the floor of a foundry? Our product is stove-plate and the floor must be as level as possible.

**Answer.**—Put in about 5 or 6 inches of cinders or broken stone, level this up with fine cinders from cupola or boiler, and over this put one or two inches of sharp sand. Level with a straight-edge: then lay hard red brick flatwise, and breaking joints lengthwise. Put plank on bricks to keep them from breaking and pound them down so that they are solid and level. Next make a grout of one part cement and two parts sharp sand, and pour it over bricks until all cracks are filled. Leave no cement on surface, except to fill cavities and uneven places. Brick makes a good gangway, as it resists the iron better than anything except clay. Clay gangways are, however, hard to keep even. To make stove-plate true, your floor must be level, and the above composition and arrangement will give the desired results.

* * *

**Question.**—We use a lot of brazing metal, and would like to make it ourselves. Can you give us a good mixture?

**Answer.**—The following mixture is extensively used for brazing purposes:—Copper, 87 per cent.; zinc, 12 per cent.; lead, 1 per cent. Zinc is used in preference to tin in making brazing metals, because the copper-zinc alloys possess a certain amount of ductility at a red heat, and do not crumble with the same facility as the copper and tin metals. The color of the metal varies from a coppery hue, with small percentages of zinc, to a reddish yellow, with higher percentages. The structure of the metal is fibrous. The copper should be melted under a cover of charcoal; a little salt being added when the ingots become red. After the copper is melted and appears limpid beneath the charcoal cover, the zinc having been previously warmed, is added in small pieces. The lead is put in next, the mixture thoroughly stirred, after which pouring is in order.

* * *

**Question.**—Can steel be melted to advantage in a cupola?

**Answer.**—A few years ago Hugh F. Jones, of Los Angeles, Cal., patented a process for producing steel castings by cupola melting. The method consists of charging the cupola with alternate layers of coke, flux and steel scrap, and the ratios mentioned are from 7 lbs. steel and 1 lb. of coke, up to 10 lbs. steel and 1 lb. of coke. The coke should be coarse, and the prices of steel should not exceed 25 lbs., the smaller pieces being charged first. Open-hearth steel should be used when the castings are to be machined, but if not, the charge can consist of 75 per cent. Bessemer steel and 25 per cent. open-hearth scrap. The flux, which principally consists of silica and iron oxide, is used in the proportion of 10 lbs. to

each ton of scrap when the coke contains 2 per cent. of sulphur. For each 1 per cent. of sulphur over or under 2 per cent., one pound of flux is added or deducted. The blast used depends on the percentage of fixed carbon in the coke; thus, for 70 per cent. fixed carbon, 8-ounce pressure is used, and for each 5 per cent. above or below this, the blast is reduced or increased 1 ounce. Additions of aluminum and ferro-manganese are made in the ladle.

* * *

**Question.**—We have trouble in getting a sand match that will stand the wear and knocking around to which it is subjected in the foundry. Could you advise us of any good mixture for this purpose?

**Answer.**—If you will try the following I think it will be satisfactory in every way:—Finely sifted gangway sand, 89 parts; finely sifted steel or iron borings, 1 part; pulverized litharge, 3 parts; boiled linseed oil, 7 parts. Mix the sand, borings and litharge when dry, taking care to keep out all moulding sand, gravel or water. After thoroughly mixing, add the 7 parts boiled linseed oil, and mix to the same temper as moulding sand. Ram this mixture into your cope-match or frame, and secure firmly with screws in preference to nails. A match made with this mixture will last for years if given half a chance. A coat of shellac and lampblack when it is dry will also help this match.

* * *

**Question.**—Please inform us in your columns devoted to questions and answers which you consider the best lining for a cupola. We are lining a new one, and we are undecided whether to use stock brick or cupola blocks.

**Answer.**—Cupola blocks require less labor and fireclay to build a lining than stock brick. A more uniform diameter to your lining can also be secured by using blocks, as there is a smaller number of joints in the block lining. It is, therefore, evident that it will outlast a lining made of stock brick, all things being equal in the material of which both are made. Have your lining divided into four or five sections, supported by rings of angle iron attached to the cupola shell. This will give you a chance to repair your melting zone without disturbing the other sections of your lining, as the melting zone burns out much more rapidly than the rest of your lining.

* * *

**Question.**—Kindly give us a good formula for phosphor bronze?

**Answer.**—The term phosphor bronze is rather vague, as it is applied to a large number of alloys of widely different compositions. When used for the purpose of a bearing, it contains a considerable percentage of lead. The following is a good bearing alloy:—Copper, 81 per cent.; phosphor-copper (15 per cent.), 3 per cent.; tin, 7 per cent.; lead, 9 per cent. Melt copper under charcoal and, when thoroughly liquid, add phosphor-copper. Let the metal stand a few minutes with furnace covering partially removed, then add tin and, lastly, the lead; afterwards stir vigorously. Of late there has been a tendency to confine the term phosphor-bronze to the strongest grades of copper-tin alloys, thus indicating by the use of this name that a bronze is required possessing the highest physical properties possible in a copper-tin alloy. A good formula for such an alloy follows:—Copper, 90 lbs.; tin, 5 lbs.; phosphor-tin (5 per cent.), 5 lbs. Add phosphor-tin first.

## COMING CONVENTIONS.

## TORONTO BRANCH, AMERICAN ELECTRO-PLATERS' SOCIETY.

THE Toronto Branch of the American Electro-platers' Society extend a cordial invitation to all interested in the electro deposition of metals, to be present at their meeting in the Occident Hall, corner Queen and Bathurst streets on Thursday, April 22, at 8 p.m. The following interesting program has been arranged:—

J. T. Burt-Gerrans, of Toronto University, will lecture on the electrolysis of copper solutions, using a projecting lantern and copper bath in operation to demonstrate the electro-chemical action which takes place during deposition of metal. Mr. Burt-Gerrans is a very fluent and energetic speaker, besides being an authority on the subject he will present.

Mr. Morrison also of Toronto University, will speak on the advantages of a training in electro-chemistry as applied to electro-plating. Mr. Morrison is instructor in the electro-plating class at the Toronto Technical School, and having had practical experience in electro-plating work, his remarks will be of particular value.

W. S. Barrows will describe the uses and advantages of Cobalt electro deposits, giving a brief historical sketch, also explaining in non-technical terms the results of his extended experiments relative to this neglected metal. Mr. Barrows will illustrate his paper with a display of ores, oxides, and salts of cobalt, also specimens of various lines of goods plated with metallic cobalt. This feature will be particularly valuable to the manufacturers of plated goods, as well as to the nickel plater.

Cobalt is rapidly becoming prominent as a metal substitute for nickel, and as it is comparatively new in the electro-plating industry, a special request is extended to those operating nickel plating plants to attend this meeting. The society desires a good representation from the metal section of the Toronto Branch, Canadian Manufacturers' Association, also from such other bodies as are in any way interested in the commercial electro-deposition of metals.

**Welding Steel.**—Cast steel:—borax 64, salammoniac 20, ferro-cyanide potassium 10, rosin 5. Boil all with some water, constantly stirring until homogeneous compound is formed. Then dry out slowly in same vessel. Welding is done at light yellow heat or towards white heat.

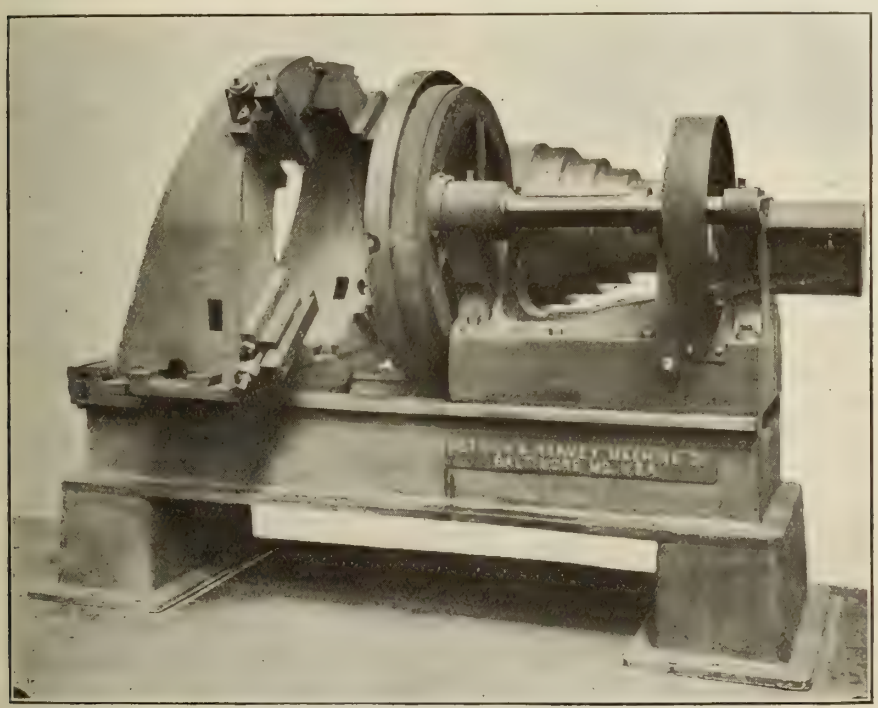
# PROGRESS IN NEW EQUIPMENT

## A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

### FLANGE FACING MACHINE.

THIS machine is designed for facing the flanged ends of large pipes, and consists essentially of three parts: a threaded head-stock carrying a rotating facing head, a vise or rest for holding the pipe to be faced and a bed for supporting the parts.

The headstock is similar in design to an engine lathe headstock and has a cone pulley and back gears for driving the spindle. Mounted on the front end of the spindle is a large face plate having a slide way and a tool slide which has an automatic feed from the periphery of the face-plate to the centre. The feed is obtained by means of a shaft extending through the hollow spindle. This shaft is driven from the rear end of the spindle by differential gearing, and in turn drives through bevel gears the feed-screw which operates the tool slide. A clutch is provided for disengaging the feed. The spindle is provided with bronze bushed adjustable bearings and an adjustable thrust bearing.



FLANGE FACING MACHINE.

The device for holding the pipe consists of a carriage mounted on the bed, having an adjustment to and from the facing head by means of a crank handle and screw, and a pair of vise jaws resembling a lathe steady rest, but made in halves and operated by a right and left-hand screw to facilitate the rapid chucking and removal of pipe. The rests or vise jaws are fitted with four lesser radial jaws having an adjustment for varying diameters of flanges. A swing locking bolt is provided at the top for clamping the rests.

The machine, which can be equipped with a small crane for supporting the outer end of the pipe, is built in two sizes, one having a capacity up to 24 in. and a larger machine having a capacity up to 38 in. There are five or six changes of speed of sufficient variation to cover the entire range of work. The small machine has 2½ in. belt on cone and the large machine a 4 in. belt. A removable device which fits in the end of the spindle is provided for squaring up the work in chucking. A countershaft with tight and loose pulleys is also supplied.

Detrick & Harvey, Baltimore, Md., are the manufacturers of the above described products.

### TURRET LATHE OUTPUT.

IT is a mistake to imagine, says the Alfred Herbert, Ltd., "Monthly Re-Review," that the installation of modern high-class labor-saving machine tools solves the question of high output and low cost. Machines can be as well made as it is possible to make them, and may embody every possible convenience and appliance for easy handling and multiple tool cutting, and still their output may be low. In order to secure the best results, it is important that the personnel should be of the proper class, that the auxiliary equipment of the shop should be complete, and that the organization of the shop should be suitable to the machine tool and auxiliary equipment, to the personnel, and to the character of the work to be done.

#### Training the Operator.

Dealing first of all with the workmen, it is important that they should be suitably trained in the use of the machines thaey have to operate, for many troubles and losses of outputs have been caused by owners of shops expecting too much from untrained men. So-called untrained men often do a good deal of damage before they become efficient, whereas a little help and training can frequently be provided by the owners of the workship with very great advantage to the output of the machines and to the accuracy of the product. To this end, it is essential that the management should include someone with a complete knowledge of the possibilities of and methods of operating labor-saving machines. This is no less important in the case of turret lathes than of other machine tools. Another requirement is that the workshop should be such that good men will be comfortable and content to remain in it, as constant change of the workmen causes dislocation and reduction in quantity of product.

#### Maintenance Equipment.

Another essential in the case of turret lathes and automatics is that the workshop should contain the necessary staff and plant for making and maintaining tools. We have known instances of workshops equipped with the most complete and expensive batteries of turret lathes and automatics, but without an efficient tool grinder, and in such a case the purchase of a cheap tool grinder frequently enables the output to be increased more than by the purchase of several additional automatics. Assuming that all the requirements in the way of workmen, supervision, and plant are provided for, good organization is necessary if waste is to be avoided, for unless cutters are kept in stock already ground, much time will be lost by the operators.

#### Organization Features.

The organization should also include the provision of proper means of in-

specting the work as it comes from the machines, and the manufacture and maintenance in an accurate condition of the necessary gauges and measuring appliances. Provision should also be made for the efficient transport of the work to and from the machines, and this should not be done by the operators, who should have nothing to do but operate their machines where the best output is required.

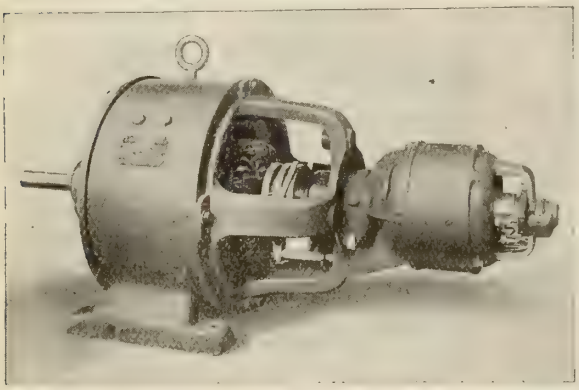
In dealing with the men on the machines, the prices of work should be arranged so as to give the workmen an opportunity of earning good bonuses by good industry, and in many cases it will be found to be satisfactory to organize the men in gangs so as to equalize the profits or losses accruing from various machines. As makers of labor-saving machine tools, it has been disappointing to us in many cases to know that the output of the machines in some works is not what it could easily become if the matters indicated above were fully appreciated.

## SMALL BELTED ALTERNATOR.

THE term "Generator" to many minds brings up the vision of huge turbo-alternators, equipped with the most elaborate devices to ensure absolute reliability, yet there are hundreds of small plants, the demand of which does not warrant the use of such huge units but where reliability is just as important.

For such service the Westinghouse Electric and Manufacturing Co., Pittsburg, Pa., has perfected a small belted alternating-current generator, with direct-connected exciter. Such an arrangement makes a very compact unit, as well as securing the highest degree of reliability and independence of operation.

This generator has a rated capacity of 20 kva. 3-phase, or 14 kva. single-phase.

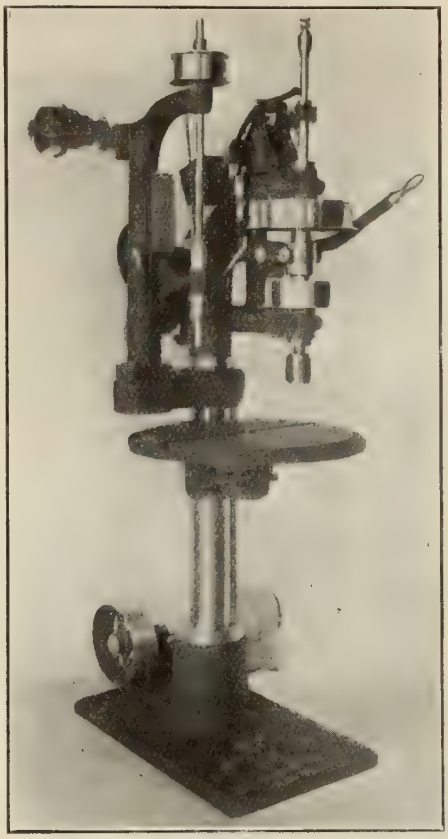


SMALL BELTED ALTERNATOR, 20 K.V.A., 3-PHASE, 60-CYCLE, 240-VOLT, 1800 R.P.M.

The standard frequency is 60 cycles at a speed of 1,800 r.p.m. and the machine is furnished to give either 120, 240, 480 or 600 volts.

## COMBINATION DRILL AND AUTOMATIC TAPPER.

THE illustration shows a combination drill and automatic tapping machine, a product of the Garvin Machine Co.,



COMBINATION DRILL AND AUTOMATIC TAPPER.

New York City, and an addition to their well-known line of automatic tapping machines. The drill head is applied to their standard No. 2 automatic tapper, is driven by a separate countershaft, and has a capacity of driving a ½-in. drill.

The tapping machine has a capacity of ¼ in. to ¾ in. U.S.S. tap in cast iron, and is automatic in its operation, as soon as the work is started.

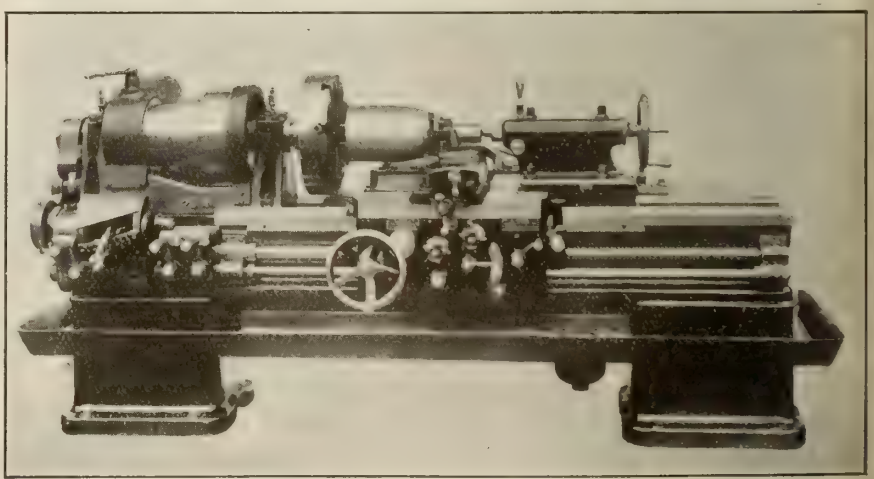
The combination makes a very handy tool, as work can be drilled and tapped without going from one machine to another.

## GRAPHITE AND STRENGTH OF CASTINGS.

THE deleterious effects of graphite were emphasized by Dr. J. E. Stead in a recent lecture in Birmingham, England, on "Some Scientific Features of Cast Iron." He described graphite as the enemy of the foundryman, and likened it to thin plates of mica which can be split along their cleavage planes with the utmost ease. He summarized the results of a large number of tests, undertaken with a view of ascertaining the influence of graphite on the strength of castings, in the following table:

| Graphite, per cent. | Transverse strength, cwt. | Tenacity, tons. |
|---|---|---|
| 3.00 to 3.25..... | 20.4 | 8.25 |
| 2.600 to 2.85 ..... | 27.1 | 13.24 |
| 2.15 to 2.55 ..... | 31.9 | 14.54 |
| 2.00 ..... ..... | 40.0 above | 17.10 |
| None, with 3 per cent. silicon ..... | 91.0 | 88.60 |

He deprecated the rule-of-thumb practice which has led foundrymen to adopt a hostile attitude towards types or grades of pig iron with which they were unfamiliar, citing the case of some irons of superlative quality which were unsalable and had to be reinserted because their fracture presented some unusual features. He argued that any class of iron could be made to yield the results desired if only it were "mixed with brains"; that even sulphur, sometimes considered the foundryman's worst enemy, could be turned to useful account if intelligently handled. This element should rather be regarded as a friend, said Dr. Stead, because it prevents the carbide from parting with its graphite.



20-INCH AMERICAN HIGH DUTY LATHE ARRANGED FOR THE PRODUCTION OF ARMOR-PIERCING PROJECTILES AND SHRAPNEL.

## THE LABOR PURCHASING DEPARTMENT.

WE are informed upon the very best authority that the average labor cost of machine shop products runs from 50 to 75 per cent. of the ultimate cost. The employment office, however, is often but the more dignified appellation of the gatekeeper's shelter or, the taking on of men may be one of the duties of an already overworked receiving clerk, and this official, to save his precious time, is generally equipped with display signs indicating the exact character of help required, in addition to that which says "No Help Wanted To-day." The foreman of a department is required to inform the gatekeeper of the class of men wanted and the wages to be paid, and here his responsibility ends until the new help appears, to be made the best of.

When a plant has grown to certain proportions, it is obviously impossible for the manager or superintendent to devote his time to the details of careful hiring of men any more than he can give his whole thought to the best market quotations on material. The employment department, which really represents the greater investment, should therefore be in the hands of a thoroughly competent and responsible man whose duties do not end with the hiring stage. He should follow his proteges' installation in the plant, should determine their efficiency and rating and should represent the last court of appeal between man and foreman.

There are numbers of little disagreeable jobs in connection with the rating and disciplining of help that are detrimental to the influence of the foreman with his men if he be required to perform such duties. The proper man to do this work is the man who does the hiring. Carelessness in the choosing of men is liable to result in the getting of careless employees. The quality of workmen is many times more valuable than the price or quality of material, and it is safe to say that the man who shrewdly controls the quality and efficiency of the human element holds the real guiding reins in the destiny of the institution.

## MAINTAINING SUFFICIENCY OF TRAINED MECHANICS.

IN connection with the recent discussions on the losses entailed by employers in replacing trained mechanics who have been discharged or otherwise lost to the organization, the side of the men themselves deserves some consideration. Take the apprentice who often becomes more proficient in the handling of certain machines than the specially hired operator, we find the instances where he is provided with a practical demonstrator or any kind of technical instruction decidedly few, it being usually a case of apprentice learn from apprentice or pick up what he can from more or less indifferent journeymen. The average ambitious young man therefore looks forward to the time when he will be free to explore new fields in his chosen trade or occupation and acquire the knowledge worth while which will secure him higher degree remuneration.

There are some notable manufacturing concerns who make a practice of developing their own skilled help and raising up their own department heads. In these cases the plants are large, involve the best practice in their respective lines and are in a position to provide better conditions for their older hands than these could perhaps obtain elsewhere. Still, more cases have come to our attention where strangers brought into the plant are paid more than the men who have spent the best years of their lives with the institution.

Again, if men are to be kept indefinitely in the same shop at the same work, and if no new blood be brought in, there will have to be some powerful influence on the part of the management to prevent a gradual slackening of interest and zeal and consequent efficiency in the work. The machinist does not get the highest mechanics' wages by any means, and the ability to travel and educate himself is one of the things he gets besides his money that helps to make up.

# SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

## PIG IRON.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., April 19, 1915.**—The general business outlook throughout the province is improving steadily with the early spring weather, and this improvement is being reflected to a greater or less extent in the building and metal working industries. Coincident with this, there is the opening of navigation, which also tends to improve all lines of business generally. It seems as if the whole situation is unprecedented. The demand for products which in times of peace are greatest seems to have disappeared, and other products are called for in their place. These new products are practically all for use in the manufacture of the munitions of war. Thus nearly all the activities in shops are of a variety which have rarely been undertaken in Canada before.

The machine tool problems are quite as complex as heretofore. It would appear now that as long as the demand for ammunition keeps up, the demand for tools capable of making steel shells, cartridge cases, time fuses, etc., will also be present and will be so as long as the war lasts.

The interrupted shipping on the high seas has a tendency to upset the metal markets in America to no little extent. However, new channels are being opened

up for consumption. Fluctuating prices as a result are the main features of the metal exchange.

### The Steel Market.

Trade in building sections is improving slightly, but at that business is far below normal. The demand for merchant bars is also small, although the commencement of the manufacture of the high explosive shells in Canada has created a demand for certain sizes of round bars. The shops engaged in the manufacture of tools from high-speed steel are very busy making special jigs and fixtures for the rapid production of shells of the various sizes. The actual tonnage of steel consumed at present is, however, away below normal, and a great deal of improvement must be made before trade can be considered satisfactory.

### Pig Iron.

As the foundry business is extremely quiet, little or no trading in pig iron is being done. Prices remain unchanged, there not being enough business to properly adjust them.

### Machine Tools.

In the machine tool trade the usual activity in turret lathes still continues to occupy the attention of most dealers. In order to assist manufacturers, many well-known firms are marketing special jigs and fixtures which can be fitted to standard machines to be used in the manufacture of shrapnel shell cases. A lively demand for such tools has existed for some time past, and manufacturers of machine tools, like most other people connected with the engineering profession, did not realize to what an extent this feature would be developed.

Thus, many shops have been thrown on their own resources, and have gone into the matter in a systematic way, and have designed their own tools and fixtures, finishing them up in their own shops. Many firms have been experiencing a shortage of forgings, and have undertaken the work of installing hydraulic presses to manufacture these. Activity in the machine tool business is for the most part centred around the shell-making industry. Certain tools such as reamers, taps, gauges, etc., are also largely in demand, the various types and sizes of shells being manufactured bringing this about. Other supplies also are moving more or less rapidly.

### Metals.

The demand for copper seems to be on the increase, and the production seems to be a little behind. Smelters working the lower grades of ore have not been operating for some time past, and it is not likely that they will commence because of the fact that it is largely a speculative proposition as to how long the higher prices will continue. Whether the demand is a normal one or not, it is not known.

A great deal of tin is afloat, bound for the American market, and this, together with the fact that considerable tonnage has already arrived at American ports, has caused the price to sag. Spelter is a little stiffer, while lead is quiet.

The shortage of antimony is being again felt, and recent demands have caused the price to rise again.

Aluminum is very quiet.

---

**Toronto, Ont., April 20, 1915.**—Industrial conditions generally are showing some improvement and a more optimistic tone prevails in business circles. The orders for war equipment are largely responsible for this, although at the same time, the outlook is better as regards ordinary trade. The opening of navigation will stimulate business to some extent, especially shipments to Western points.

### Steel Market.

There is little change to note in the steel trade this week, although the outlook is improving to some extent. Orders for lyddite shells are being distributed and there is a corresponding increase in the demand for round steel bars for this purpose. There is also a steady demand for steel forgings for shrapnel shells, the mills working to capacity to meet the requirements. It is reported that the Dominion Steel Corporation's export business is improving for both war supplies and general lines. The plant is working at 70 per cent. capacity. The building trade is quiet and indications do not point to any marked improvement for some time, consequently the demand for structural shapes is light. There is a little better business moving in merchant bars but it is under normal. Prices are unchanged but firmer.

Conditions in the steel trade in the United States are slowly improving. Prices are very firm, the leading mills quoting 1.20c on bars and shapes for delivery up to July. Large orders for shrapnel shells have been distributed and considerable export business is being done in other lines. Steel works are operating on an average of between 65 and 70 per cent.

### Pig Iron.

The market continues in a dull condition with foundries working at considerably reduced capacity. All old country brands of pig iron have made sharp advances in price, which will to a large extent eliminate them from this market. Local quotations on domestic brands are unchanged.

### Machine Tools.

Shell machinery continues to dominate the market, although not to the same extent as earlier in the year. Some difficulty is still being experienced in obtaining satisfactory deliveries, which is having a tendency to hold up business. Second-hand tools suitable for shells are also in active demand. Enquiries being received now by local dealers are principally for lathes and heavy drills for the lyddite shells. The woodworking machinery business is quiet, but the demand for tools for general purposes is picking up, several good enquiries having been sent out during the week.

### Supplies.

The improvement in the demand for machine shop supplies continue, although orders generally are for smaller lots than usual. An advance of 2c in turpentine is noted and quotations are firm at 73c per gallon. Linseed oil declined 2c and is now quoted at 78c for raw oil. Other lines are unchanged.

### Scrap Metals.

The scrap metal trade is quiet but prices are firmer all round. Copper and brass scrap have advanced 1c and ½c per pound, respectively, due to the strength in the copper market.

### Metals.

Business in the metal market is gradually picking up, but is still of the hand-to-mouth order. There is an increasing demand for copper, lead and antimony, especially the former, for war munitions, the market consequently is very strong. Some relief is expected in the tin situation, but the market is still very unsettled.

**Copper.**—The enormous demand for copper for war munitions continues and is reflected in the market, which is very strong. The consumption of copper for war materials cannot fail to go on increasing for some time to come. In the local market copper has advanced ½c and is very firm at 17¾c per pound.

**Tin.**—The market for spot tin is still very unsettled but there is a possibility that the British Government will withdraw some of the restrictions recently placed on the export of tin, at least as far as the States is concerned. This will relieve the situation considerably. Spot tin is scarce but supplies of futures are ample. Quotations are nominal at 54c per pound.

**Spelter.**—The market is unsettled and supplies are scarce. Quotations are nominalat 12c per pound.

**Lead.**—The demand from Europe continues large and the market is firm. Prices are unchanged at 5¾c per pound.

**Antimony.**—The market is strong on heavy demand. Prices are nominal and unchanged at 25c per pound.

**Aluminum.**—Quotations are unchanged at 23c per pound.

# Trade Gossip

**Cost of Flour Contribution.**—Canada's 1,000,000 bags of flour to England cost the Trade and Commerce Department $3,005,540, purchases having been made as follows: Western Canada Flour Mills, Ltd., $350,000; Dominion Flour Mills, Ltd., $56,000; Lake of the Woods Milling Co., Ltd., $280,000; Maple Leaf Milling Co., $1,164,842; St. Lawrence Flour Mills Co., $112,000; Ogilvie Flour Mills Co., $840,000; ocean freight and insurance, $201,828; rent of harbor and shed, $825; printing bills of lading, checking, etc., $44.

**Machine Guns Gifted.**—J. B. Fraser, the Ottawa lumberman, has donated two additional machine guns to the machine gun section of the 8th Canadian Mounted Rifles. The section will thus be increased from a two-gun equipment to a four-gun equipment, and will be under the command of Lieut. Fraser, second son of the donor. Mr. Fraser has already given one machine gun, while the Militia Department provided another to the section. Lieut. Hugh Fraser, another son, is at the front with the first contingent, and was an officer in the Governor-General's Foot Guards.

**Production of Molybdenite.**—The Ontario Department of Mines has received inquiries from the Imperial Institute, London, with regard to the production of molybdenite in Ontario. This metal is at present much in demand in Britain for steel-hardening in the manufacture of armaments. The names of producers and samples of the deposits are asked for. Molybdenite exists in quantities in northern and eastern Ontario but as yet there has been no commercial production of this metal, which it is now hoped may be stimulated by the market now opened. Tungsten is also required in England for steel hardening to replace the supplies formerly obtained from Germany, and the Provincial Mines Department is making an investigation to ascertain whether the industry can be developed in Ontario.

**Russian Government Shell Order.**—The big order recently received by the Canadian Car & Foundry Co. from the Russian Government calls for 2½ million high-explosive and 2½ million shrapnel shells, the contract price running to over $80,000,000. At the present time negotiations are proceeding with some twenty-five Canadian manufacturers as subcontractors for the production of approximately one million shells. Delivery of the whole is called for by January 31, 1916. On account of Canadian firms being almost fully employed meantime on the manufacture of British 18-pounder shrapnel, the bulk of the Russian order will of necessity be placed with U. S. firms.

**Brantford, Ont.**—The Hydro-Electric Commission are calling tenders for a large addition to the sub-station here.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

# INDUSTRIAL AND CONSTRUCTION NEWS

**Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.**

## Engineering

**Ottawa, Ont.**—Cowie & Moore have let several contracts for their proposed machine shop here.

**Brantford, Ont.**—It is announced that the Ker-Goodwin Co. have received an order for shrapnel shells.

**Hamilton, Ont.**—It is announced that the Canadian Horseshoe Co. will begin construction of their new plant very shortly.

**Sackville, N.B.**—The Fawcett foundry which has been closed for some months will, it is expected, resume operations shortly.

**Cobalt, Ont.**—It is reported from Timmins that plans are under way for the construction of a stamp mill for the Acme property.

**North Bay, Ont.**—It is rumored that a party of New York capitalists has taken over the Trout Mills smelters. A large gang of men have been put to work repairing and fitting up the works.

**Cobalt, Ont.**—The news has reached here of a fire at the Miracle Mine, in Langmuir Township, causing much damage and seriously hampering operations. The power-house and its contents were totally destroyed.

**Dauntless, Alta.**—The Dominion Harvester Co. will establish a plant here. Tenders will be called shortly for machine tools and machine shop equipment. Gilbert Hunt of Walla Walla, Wash., is interested. The general contractors are the Hunt Engineering & Sales Agency, Los Angeles, Cal.

**Chatham, Ont.**—It is reported that a million-dollar sugar beet factory will be built in Chatham this year by the Dominion Sugar Co. of Wallaceburg. A site has been purchased and work will be started as soon as a by-law granting concessions has been carried. The council will be asked to provide part of the site to the value of $18,500 and give exemption from taxes for ten years.

## Electrical

**Almonte, Ont.**—A report is being prepared by O. F. Adams, of the Hydro-electric Commission, on the development of a power plant here.

**Weyburn, Sask.**—The installation of a fire alarm system has been approved by the city council.

**Vancouver, B.C.**—The city council of North Vancouver are contemplating installing a water wheel and generator.

**Owen Sound, Ont.**—The plans of the transformer station for the hydro-electric will be here soon, according to Secretary J. Parker, of the Utilities Commission. When the plans are all received it is the intention to ask tenders on the work on construction.

## Municipal

**Peterborough, Ont.**—Work has been started on the construction of a sewage disposal system.

**Richmond, B.C.**—The city council contemplate extensions to the waterworks system at a cost of about $40,000.

**Weyburn, Sask.**—The city council are considering the purchase of a booster pump for fire protection. A 12-in. water main may also be installed.

**Lindsay, Ont.**—The by-law to guarantee the bonds of the Canadian Boving Co., Ltd., was voted on here on April 14 for a second time and defeated.

**Swift Current, Sask.**—A by-law is contemplated for raising $75,000 for completion of the electric light and power plant.

**Kamloops, B.C.**—Ducane, Dutcher & Co., engineers, of Vancouver, are preparing plans for proposed extensions to the street lighting system.

**Ridgetown, Ont.**—The Town Council has unanimously decided to submit a by-law to the people calling for the installation of a Hydro-Electric system.

**Montreal, Que.**—The contract for the proposed civic library at Lafontaine Park will most probably be awarded to Quinlan & Robertson for $461,000.

**Montreal, Que.**—The plans for the proposed extension to the filtration plant will be prepared here from data furnished by the engineers, Hering & Fuller of New York.

**Ridgetown, Ont.**—The council has adopted the Hydro Commission's report for a new lighting system. A by-law will be prepared to authorize the estimated expenditure of $12,000.

**Three Rivers, Que.**—The city council have engaged R. S. and W. S. Lea, consulting engineers, Montreal, to prepare a report with regard to improvements to the waterworks system.

**Toronto, Ont.**—Tenders will be called for a reinforced concrete bridge over the Belt Line tracks on Mount Pleasant Road. This is an alternative proposition to a steel bridge previously decided upon.

**Toronto, Ont.**—The Board of Control has decided to recommend that the report of Commissioner Wilson regarding the incinerator be adopted. This means the acceptance of the tender of the Canadian Griscom-Russell Co., of Montreal, at $49,200.

**Verdun, Que.**—The city council has passed the first reading of a by-law to permit the issue of $400,000 debentures. Part of this, amounting to $75,000, will be spent on waterworks and electric light extensions. Water mains and sewers, etc., will account for $25,000.

## General Industrial

**Lethbridge, Alta.**—A tannery is being built here by a Mr. Colver of Toronto.

**Strathroy, Ont.**—The Union Gas Co. will drill a number of wells in this district.

**Regina, Sask.**—A company is being organized to establish a plant for making steel culverts.

**Sherbrooke, Que.**—A new plant will be established here by a Mr. Ashenhurst of Chicago for making asbestos products.

**Niagara Falls, Ont.**—The Hydro-Electric Commission are now making headway with the work of drilling test holes for a proposed canal from Chippawa to the Whirlpool.

**Chatham, Ont.**—The plant of the Canadian Wolverine Co. was destroyed by fire on April 10. The loss is estimated at $125,000 and is covered by insurance up to 80 per cent.

**Saskatoon, Sask.**—The Canada West Grain Co., whose headquarters are in Melfort, are making arrangements to increase their elevators from eight to ten, possibly eleven.

**Toronto, Ont.**—The large brick factory lately owned by the Novi-Modi Costume Co., now in liquidation, has been sold to Cutten & Foster, manufacturers of automobile and boat supplies.

**St. John's, Nfld.**—Announcement is made of the registration by Thomas Leopold Wilson, of Ottawa, of a company with a capital of $2,000,000, formed to develop electrical energy for the manufacture of fertilizers in this colony.

**Sedgwick, Alta.**—The Alberta Farmers' Co-operative elevator was burned to the ground here on April 10. The elevator was built by the Farmers' Co-operative Elevator Co., of Sedgwick, Ltd., at a cost of about $8,000. Both building and grain were covered by insurance.

**Toronto, Ont.**—The Corn Products Refining Co., a United States corporation capitalized at $8,000,000, has completed plans for opening a plant in Ontario. The proposed plant will use about 10,000 bushels of grain in a day. It is probable that the plant will be located here or in Hamilton.

## New Incorporations

**The Dominion Bridge Co.**, Montreal, has had the charter extended to cover the manufacture of projectiles, guns and armoured cars, etc.

**The Diebel Furniture Co.** has been incorporated at Ottawa, Ont., with a capital of $50,000 to manufacture furniture at Stratford, Ont. Incorporators: C. Diebel, E. Diebel and E. E. Diebel, all of Hanover, Ont.

**The Sarnia Metal Products Co.** has been incorporated at Ottawa, Ont., with a capital of $100,000 to manufacture sheet metal products at Sarnia, Ont. Incorporators: Lloyd Lott, A. MacD. Lott and J. Garroch, all of Sarnia, Ont.

**The Standard Planing Mills, Ltd.**, has been incorporated at Toronto, Ont., with a capital of $40,000 to operate planing mills at North Bay. Incorporators: C. W. Wilkinson, S. L. Mulholland and H. G. McDermaid, all of Toronto, Ont.

**The Rathbun Match Co.** has been incorporated at Ottawa, Ont., with a capital of $125,000 to carry on the business of a match factory at Desoronto, Ont. Incorporators: R. P. Locke, G. Cooper and Wm. Kaspar Fraser, all of Toronto, Ont.

**The Franklin Steel Works, Ltd.**, has been incorporated at Toronto, Ont., with a capital of $40,000 to manufacture toe calks at Hamilton, Ont. Incorporators: William Lees, Thomas Hobson and R. P. McBride, all of Hamilton, Ont.

**The Winnipeg Oil Co.** has been incorporated at Ottawa, Ont., with a capital of $1,000,000 to refine and deal in petroleum, natural gas, etc., at Winnipeg, Man. Incorporators: W. A. J. Case, C. G. Lynch and W. J. Beattie, all of Toronto, Ont.

**The Reid Appliance Co.** has been incorporated at Ottawa, Ont., with a capital of $50,000 to manufacture automobiles, motor boats, etc., at Windsor, Ont. Incorporators: T. B. Mothersill, A. R. Bartlet and W. G. Bartlet, all of Windsor, Ont.

**The American Nitrogen Co.** has been incorporated at Ottawa, Ont., with a capital of $4,000,000 to manufacture nitrogen, nitric acid and other acids at Montreal, Que. Incorporators: G. A. Campbell, F. Langford and Winthrop Brainerd, all of Westmount, Que.

**The Kerosene Burning Carburetor Co.** has been incorporated at Ottawa, Ont., with a capital of $100,000 to manufacture automobiles, motor cycles, etc., at Berlin, Ont. Incorporators: J. Darcy, C. Forsyth, B. S. Sheldon and O. F. Dannecker, all of Berlin, Ont.

**ALLIES PURCHASING AGENTS.**

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**British.—Lieut. Johnston and A. C. Billing, Ritz Carlton Hotel, Montreal.**

**French—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**

**Russian — Messrs. S. Ruperti and Aiekieff, care Military Attache, Russian Embassy, Washington, D.C.**

## Tenders

**Hamilton, Ont.**—Tenders will be received up to April 27 for one eight million gallon capacity centrifugal sewage pump and motor. Specifications may be obtained at the office of the city engineer, A. F. Macallum.

**Ottawa, Ont.**—Tenders will be received by the secretary of the Water Works Committee, Ottawa, up till Wednesday, May 12, 1915, for the supply and erection of one electrically-operated pumping unit. Specifications and full particulars may be obtained on application to the city engineer's office, city hall, Ottawa.

**Ottawa, Ont.**—Tenders for alterations and addition to Postal Station "A," Toronto, Ont., will be received until Monday, April 26, 1915. Plans, specification and form of contract can be seen and forms of tender obtained at the office of Thos. A. Hastings, clerk of Works, Postal Station "F," Yonge St., Toronto, Ont., and at the Department of Public Works, Ottawa.

**Ottawa, Ont.**—Tenders will be received until Wednesday, May 5th, 1915, for the supplying, manufacturing and erecting wagon and cylindrical valves for certain locks on the Trent Canal. Plans, specifications and forms of tender can be obtained by application to the chief engineer, Department of Railways and Canals, Ottawa, or to superintending engineer of the Trent Canal, Peterborough, Ont.

**Ottawa, Ont.**—Tenders will be received until Wednesday, May 5th, 1915, for the manufacture and delivery of operating machines, anchorage fittings and pivots for locks, and gains for emergency steel stoplog bridges for the Trent Canal. Plans, specifications and forms of tender can be obtained by application to the chief engineer, Department of Railways and Canals, Ottawa, or to superintending engineer of the Trent Canal, Peterborough, Ont.

## Contracts Awarded

**London, Ont.**—The waterworks supplies for the year will be purchased from the Empire Mfg. Co. of this city.

**Montreal, Que.**—The following contracts have been awarded by the Board of Control in connection with the new lighting system on St. Catherine and Bleury streets: Lamp standards, G. M. Gest, $6,090; cables, the Eugene F. Phillips Electric Works, $21,211; lamps, the Canadian General Electric Co., $10,657.

**Winnipeg, Man.**—The contract for the construction of a steel and concrete bridge over the first crossing of the Nelson River on the Hudson Bay Railway has been awarded to the Canadian Bridge Co., of Walkerville, Ont. The bridge will be 500 feet long, with a main span of 305 feet. The cost will be about $175,000.

# Building Notes

**Toronto, Ont.**—The C. P. R. will build a new station at North Toronto. Darling & Pearson, of Toronto, are the architects.

**Victoria, B.C.**—A permit has been issued to T. R. Cusack for a warehouse to cost $5,000. C. E. Watkins is the architect.

**Georgetown, Ont.**—The general contract for the erection of a transformer station here for the Toronto Suburban Railway Co., has been let to Wells & Gray, Toronto.

**Halifax, N.S.**—Immediate construction of an academy building at a cost of $30,000, to replace the one recently destroyed by fire, has been decided upon by the Board of Governors of Acadia University, Wolfville.

**Toronto, Ont.**—Plans submitted by R. C. Bustard to the City Architect's Department for a six-storey store and office building on the east side of Yonge Street, near Isabella, have been approved. The building is to cost $29,000 and will be a brick and terra cotta structure.

**Toronto, Ont.**—The City Architect's Department issued a building permit to the Board of Education for the erection of the new Administration Building on College street, near the old Technical School. The new structure, which is to cost $100,000, will be built of brick and steel and will be four storeys in height.

**London, Ont.**—At a special meeting of the Board of Education, held recently, the following architects were selected: It was decided to give the North-End School to Watt & Blackwell and W. G. Murray; the Princess Avenue School to McBride & Gilbert and A. E. Nutter, and the Riverview and West London Schools to Messrs. John M. Moore, J. Vicar Munro and L. E. Carrothers. The first job will be worth $55,000, the second $70,000, and the third $55,000.

# Personal

**John S. Anthes**, one of the oldest and best known furniture manufacturers in Ontario, died at Berlin, Ont., on April 13, in his 71st year.

**E. R. Gray** of the Toronto Works Department, has been recommended by the Hamilton Board of Control as assistant city engineer in that city.

**Ralph Hewson**, assistant engineer, Toronto Harbor Commissioners, has left for St. John, N.B., to join the Canadian Pacific Overseas Construction Corps, which leaves for France early next month.

**Andrew Joseph Wilson**, for 18 years manager of the Linde Canadian Refrigeration Co., died at his home, 78 St. Alban street, Toronto, on April 18. The late Mr. Wilson was born at Gaspe, N.B., and came to Toronto in 1895. He was 39 years old, and retired from the above company about 3 years ago.

**Lieut.-Col. Lacey Johnson**, who was recently appointed general welfare agent of the Canadian Pacific Railway, died on April 17 of peritonitis, after three weeks' illness. He was born at Abington, Berkshire, England, and was in his sixtieth year. Lieut.-Col. Johnson, at the time of his appointment to the position of general welfare agent of the C. P. R.,, was general superintendent of the Angus shops, and had been connected with the C. P. R. since 1882.

# Refrigeration

**Regina, Sask.**—The city council are considering the advisability of establishing a municipal abattoir and chilling plant. The city commissioners have been instructed to prepare an estimate of the cost.

**Tillsonburg, Ont.**—The Borden Company are preparing to build an extension to their plant to be used for cold storage and as a shipping room. The company is contemplating an addition to their factory at Ingersoll and have asked the council of that town for an option on 110 square feet of land owned by the corporation.

# Wood-Working

**Owen Sound, Ont.**—Wm. Pedwell's sawmill was destroyed by fire on April 17. The loss is estimated at $10,000.

**Halifax, N.S.**—The Piercy Supply Co. propose to re-open their factory and woodworking plant if they can obtain concessions from the city.

# Railways—Bridges

**Edmonton, Alta.**—The Government resolution providing for a guarantee of the branch line of the Edmonton, Dunvegan and British Columbia Railway from a point on the main line south to Grande Prairie, a distance not exceeding 60 miles, at $20,000 per mile, passed in the Legislature on April 14 by a vote of 30 to 16.

**Transcona, Man.**—W. J. Christie, of the firm of W. J. Christie & Co., Union Bank building, Winnipeg, proposes to build a street car line from the corner of Oxford and Regent, Transcona, to the western limits of the town, to connect with the Winnipeg street car on Talbot avenue, Elmwood.

# Marine

The storm signal service was resumed on all of the lakes on April 16, and will be continued until the close of navigation.

**Amherstburg, Ont.**—Under a new ruling of the Canadian Department of Marine and Fisheries, Canadian fishing tugs on Lake Erie are being numbered and the names of fishing firms are being placed on buoys marking the territory of each to facilitate supervision by Government patrol boats.

**Quebec, Que.**—G. T. Davie & Sons, Levis, have secured a contract from the United States Government for the construction of twenty motor boats, each of which is to be seventy-five feet in length. The boats will be constructed in the company's yards at Lauzon.

**Montreal-Longueuil Ferry.**—The new steamer Louis Philippe, specially built for the Longueuil service by the Canada Steamship Lines, is to be placed on the route shortly after the opening of navigation, replacing the steamer Longueuil. It is expected that the new steamer will materially shorten the time between Longueuil and Montreal, and will prove a boon to the Longueuil public.

**"Scottish Hero" a Coaster.**—The Scottish Hero, the largest of the turret class on the upper lakes, has gone to Ashtabula, where she will be cut in two and towed to the coast, to operate on a three-year charter. It is just ten years since she arrived on the upper lakes, having been brought out from England, cut in two at Levis and towed to Buffalo, where she was riveted up again, and has plied on the upper lakes continuously since.

**New Canadian Train Ferry.**—A new ice-breaking train ferry for the Strait of Canso service, between the Nova Scotia mainland and Cape Breton, was launched on the Tyne on April 13 from the Armstrong, Whitworth Co. yards. Lady Drummond, of Montreal, in christening the vessel Scotia II., made a happy speech. Ships were always referred to by the feminine pronoun, she said, and this was a compliment to the sex, as ships played an important part in linking and consolidating the Empire. The women of the Dominion which the

# A MODERN SAVER

## of Time, Money, Space and Labor

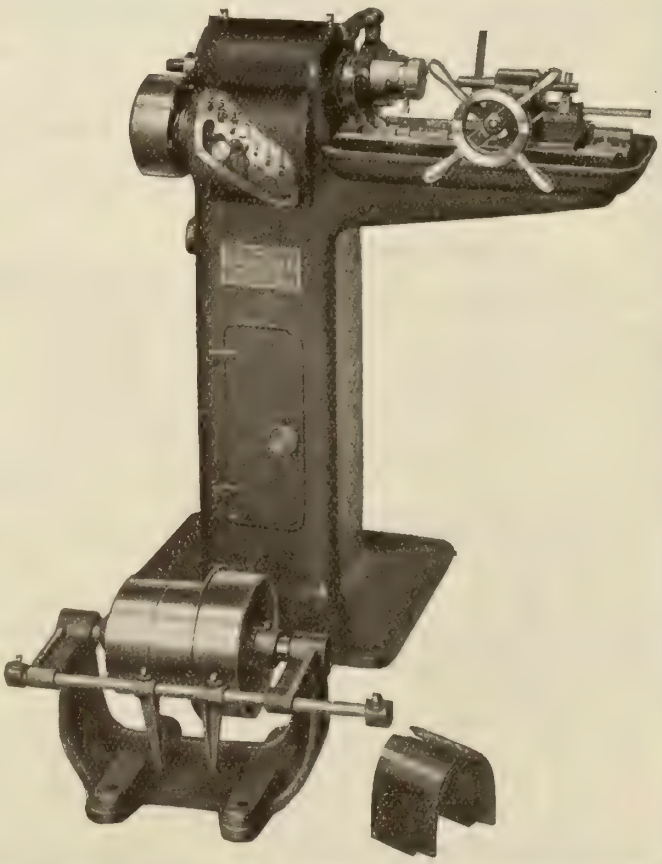
**NEW HAVEN, CONN., U.S.A.**

Canadian Agents: Williams & Wilson, Ltd., Montreal; The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg, and St. John, N.B.



vessel was to serve were in like manner doing their part in serving the interests of the Empire. The Scotia is 300 feet long over all, 20 feet in depth molded, and having a draft of 14 feet. She is of 3,850 tons displacement. Her contract speed is 10¼ knots, and she has double sets of triple expansion engines.

# Trade Gossip

**The A. R. Williams Machinery Co.**, Toronto, have sold to the Board of Education for the new Technical School, Toronto, a number of tools, including a die sinker, grinder, shaper, stamping press and milling machines.

**The Sarnia Metal Products Co., Ltd.**, have appointed George W. Britnell, vice-president of the Toronto Builders' Exchange, as their sales manager, with office in the Builders' Exchange, 154 Simcoe Street, Toronto.

**Toronto Harbor Improvements.**—The Harbor Board have notified the Board of Control that they wish to commence the reclamation of park lands on the Island and on the western waterfront at a cost of $407,862, the interest of which, amounting to $24,471, will have to be met by the city. For the season the Harbor Board propose to reclaim, by dredging, a certain amount of land lying to the east and west of Ward's Island for the purpose of furnishing additional camping ground. This will entail the pumping of 103,508 cubic yards of material. Immediately west of Ward's Island another area is to be reclaimed, and to get the proper elevation 654,013 cubic yards of material will have to be pumped.

# Catalogues

**Coal Drier.**—Bulletin No. 212, issued by the Link Belt Co., Philadelphia, Pa., describes the "Wendell" centrifugal coal drier, which is an automatic machine for drying washed coal for coking purposes. A description is given of the machine and the illustrations show the general construction.

**The Walcott & Wood Machine Tool Co.**, Jackson, Mich., have sent us a series of seven leaflets dealing with the Walcott lathes and high-duty crank shapers. The principal dimensions are given for each tool and the features of special value embodied in the design are fully described. The illustrations give a general idea of the design and construction of both the shapers and engine lathes.

**The Hydraulic Press Mfg. Co.**, Mount Gilead, Ohio, have just issued a booklet entitled "About Hydraulic Presses and Pumps." This booklet, which has been prepared as a souvenir of the company's exhibit at the Panama-Pacific Exhibition at San Francisco, reviews in a comprehensive manner the growth and scope of the organization. Other matter includes descriptions of a few representative designs of presses and pumps, all illustrated, and a list of catalogues which are ready for distribution. The booklet contains 16 pages and is gotten up in attractive style.

**Precision Lathes**, made by the Hardinge Bros., Inc., Chicago, Ill., are fully described in a catalogue recently to hand. The catalogue deals chiefly with the "Cataract" quick-change swing precision lathe, but a vertical bench miller is also described. A full description with general dimensions is given of the lathe and the principal features are dealt with in detail. The various types of bench lathes are described with price list for the different attachments. The half-tones are exceptionally good and show clearly the general design and construction.

**Electric Arc Welding.**—Bulletin No. 48,904, just off the press, has been issued by the Canadian General Electric Co., Toronto. The bulletin deals briefly with three processes of welding by means of electricity, which is followed by a full description of a general process of electric arc welding, covering the principal features in its operation. Full particulars are given of the welding equipment and its application to various forms of service. A number of illustrations are included showing different classes of work done by electric arc welding. Copies of this bulletin can be obtained on application.

## AIRCRAFT IN WARFARE.*

ROUGHLY speaking, there are only two descriptions of air-craft in military use, those which are heavier than air and which depend for sustentation entirely upon aero-dynamic reaction, and those which are sustained in mid-air by containing a gas which is lighter than air itself. The kite and the aeroplane and seaplane belong to the first category, the balloon and the dirigible to the second. In order to make progress through the air, propellers or air-screws have to be used for traction or propulsion, in conjunction with vertical directing planes or rudders and horizontal or balancing planes for equilibrium.

### Kites.

Kites, by far the most ancient of aerial machines, are employed in strings or groups to carry aloft a single observer in a basket car, and the spherical balloon or kite-balloon will carry more than one. In either case the movement of the tethered machine is apt to be disturbing to the vision of the observer, but they can be moved about and lowered or allowed to ascend, being attached to wheeled vehicles provided for the purpose and often do good service. The power-driven kite or aeroplane, and the airship or dirigible balloon of cylindrical or pisciform shape, in addition to affording an elevated platform, enable the observer to accomplish horizontal movements.

The object of using mobile aircraft is to enable the occupants to travel in three directions—upward, downward and forward above the theatre of war, and examine all that is below them from the overhead or bird's-eye point of view. They are employed at present mainly for reconnaissance or the securing of information by specially trained observers, but they are also incidentally available for aggressive purposes. The seaplane, in addition to being a flying machine, can also travel on the surface of the water by means of its propeller, and the floats which it carries under the body in lieu of the wheels on which the aeroplane runs along the ground to get impetus before rising into the air.

### Aeroplanes and Monoplanes.

Of the two classes of aeroplane, the monoplane, with its single supporting surface, is, other things being equal, speedier than the biplane with its two super-imposed supporting planes, but the latter is steadier, and the pilot's and the observer's seats can be arranged so as to afford a better view of the ground beneath.

### Airships.

Airships are usually termed rigid, semi-rigid, or non-rigid. The first type, to which the well-known Zeppelin dirigible belongs, has a stiff framework of wood or aluminum alloys, divided longitudinally into compartments, each containing a separate balloon or gas-holder. The whole framework is covered with waterproof material to give a smooth outer surface and preserve the balance from the effects of sun and rain, both of which have a very deteriorating effect on the fabric of the envelopes. The cars, containing engines, crew and observers, are connected to the underside of the framework, and there is an enclosed gallery for communication between the cars. The propellers are carried on projecting brackets at either side of the cylindrical body, and the horizontal and vertical planes and rudder at the stern; both bow and stern are bluntly pointed. This type can be constructed with a platform on the top of the cylinder, to carry observers and machine-guns, and connected with the gallery by a well-ladder; but owing to the liability of ig-

nition of the mixture of gas and air caused by leakage of the balloons, it is doubtful whether firearms could safely be used on this platform.

In semi-rigid airships the envelope is flexible. The weight of the single car is distributed over the length of the envelope by means of an intermediate girder of metal tubing. The envelope keeps its shape by reason of the gas pressure within. In non-rigid airships, the car is suspended directly from a flexible envelope without the intervention of a girder. The rigid airship has, so far, been the speedier of the three types.

In the case of non-rigid dirigibles, such as the Parseval, in order to keep up the internal pressure and maintain the shape of the envelope in case of loss of gas, there are flexible airbags or ballonets inside the gas-container, which at starting can be left empty and lie flat, but can be pumped full of air by a separate tube to fill up the cubic space of the container, which has become void during a journey.

FACTORY BUILDING, APPROXIMATELY 9,000 feet floor space, separate office building, two railway lines, water power and auxiliary steam plant. 30 miles from Toronto. Free for one year. Apply Wrights, Limited, 22 College St., Toronto.

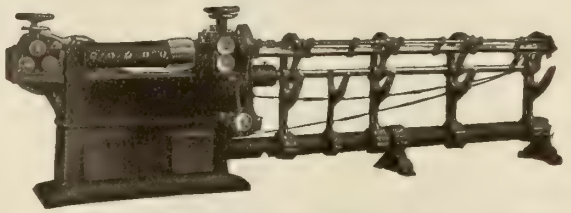
## Genuine Armstrong Stocks and Dies

Hinged Pipe Vises.
Pipe Cutters. Steam and Gas Fitters' Tools.
Pipe Machines for Threading Pipe.
Either Hand or Power.

*Manufactured by*

THE ARMSTRONG M'F'G CO.
328 KNOWLTON ST. BRIDGEPORT, CONN.
NEW YORK, 248 CANAL ST.

## Automatic Wire Straightener and Cutter



PUT IT TO WORK
cutting up those coils of wire, and let it earn its cost. Every length will be an exact duplicate of the preceding one, and all will be absolutely straight.
Costs little to run, because it requires little attention beyond placing the coils of wire.
Catalogue gives full information.

The F. B. SHUSTER COMPANY, New Haven, Conn.
Formerly John Adt & Son. Established 1866
Also makers of Riveting Machines, Sprue Cutters, Foot Presses, etc.
Canadian Agents: A. R. Williams Machinery Co., Toronto.

## Our 23" Mechanic's Drill

has features with which you may not be familiar.

There are eight speeds provided, with quick advance and return.

Stationary Head and Back geared with automatic stop. This drill can be motor-driven and will drive high-speed drills to their utmost capacity. The quality is the same as all "Rockford" quality—the best.

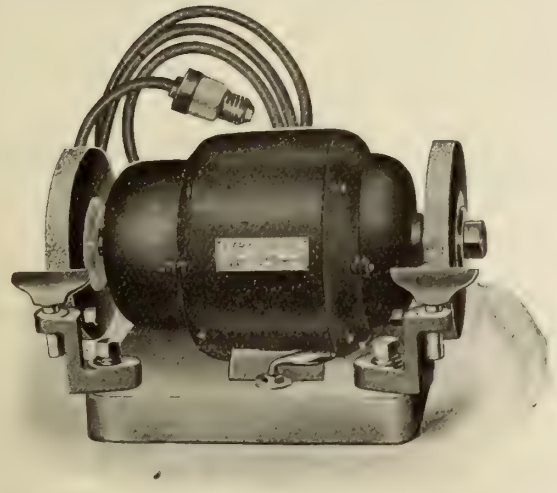
## ELECTRIC BENCH GRINDER

**You will find it the handiest tool in your Shop!**



**We are now prepared to supply them as follows:**

No. 1,1/6 H.P., A.C., capacity two 6 x ¾ in. Emery Wheels.
No. 2, ¼ H.P., A.C., capacity two 6 x 1 in. Emery Wheels.
No. 2, ¼ H.P., D.C., capacity two 6 x 1 in. Emery Wheels.
No. 3, ½ H.P., D.C. capacity two 8 x 1 in. Emery Wheels.
No. 4. 1 H.P., D.C., capacity two 10 x 1 in. Emery Wheels.

**STOW MFG. CO.**
BINGHAMTON, N.Y., U.S.A.

## Particularly Adapted to the Manufacture of Shrapnel

**Your Lathe Needs A NEW TOOL POST, One of the Modern Multiple Type.**

You can no longer afford to use the old style single tool holder.

Give us the size of the dovetail on your lathe carriage and height to lathe center; we will quote you price on a Modern Tool Holder that we guarantee will increase your production, and give you some interesting facts about Lathe Turrets.

No matter what make or size of lathe—we can fit it.

**Fay & Scott, Dexter, Me.**

## The BARNES DRILLS

Complete line. 8-inch to 50-inch swing

**Gang Drills.—Horizontal Drills.**

# ELECTRIC STEEL CASTINGS

E&M
BRAND

**Stands for Quality.**

High-Grade Steel Castings of every description.
Clean, Sound, and true to pattern.
From 1 lb. and upwards.

Manganese and all Alloy Steel Castings, Mining Bar and Rock Drill Steel, Forging Ingots.

**WRITE FOR PRICES AND PARTICULARS.**

## THE ELECTRIC STEEL & METALS COMPANY, LTD.

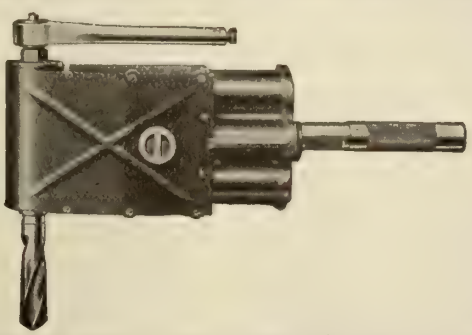
**Welland - Ontario**

# Cleveland Riveting and Chipping Hammers

Fitted with either Inside or Outside Throttle Lever as preferred. They are made in several different sizes and weights for all classes of work.

The Riveting Hammers have a range in rivets from ¼ inch to 1½ inches.

**CLEVELAND CORNER DRILL For Close Quarter Drilling**



The Body of the Cleveland Corner Drill is in one piece with cylinders and valve chambers cast integral which insures absolute alignment of working parts.

The Driving Crank is mounted upon Annular Ball Bearings which reduce friction to a minimum. Made in two sizes, Nos. 38 and 49, with Nos. 3 and 4 Morse Taper Sockets.

**Either size machine will drill or ream within 1⅛ inch of side wall or corner.**

**IN STOCK:—Sand Rammers, Bench and Floor, Portable Emery Grinders, Air Drills, etc.**

## BOWES AUTOMATIC AIR HOSE COUPLINGS

**Over 1,000,000 in general use**

¶ They are instantly connected or disconnected.

¶ They are absolutely tight under all pressures.

¶ They are interchangeable in all sizes commonly used.

¶ They quickly pay for themselves by stopping costly leaks.

WHEN you need new equipment or supplies for your machine shop

**Consult this Directory**

¶ You'll find listed here the reliable makers of the lines you need; firms who believe in the progressiveness of present-day manufacturers and who appeal to their intelligence through their own engineering journal.

¶ Consult Canadian Machinery Buyers' Directory and you can't go wrong in your buying.

Books for Foundrymen

Three good Books that should interest Foundrymen who wish to know more about their work.

**PATTERN MAKING. By James Ritchey,** Instructor in Wood Working, Armour Institute of Technology. 100 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price ..... $1.00

**FOUNDRY WORK. By Wm. C. Stimpson,** Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price, ..... $1.00

**PATTERN MAKING. By G. H. Willard.** To which are added chapters on Coremaking and Molding. 214 pp., 312 illustrations. Cloth binding Dealing with the practical experience of foundry work, tools required; woods adapted for the work; turning; and all kinds of patterns. Price, postpaid .. $1.10

# No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.
Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.
*How to use Stevens' Stopper, or Circle Cement:*
Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.
Another thing—I do not ask a fancy price for it.
A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

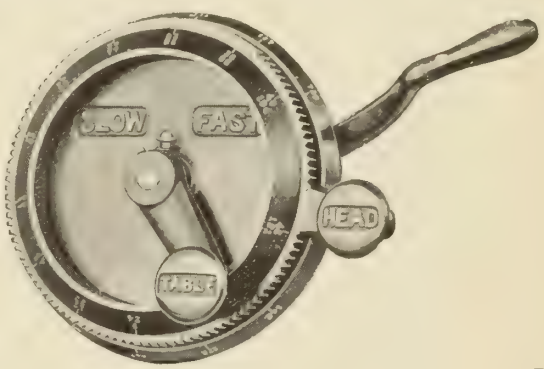
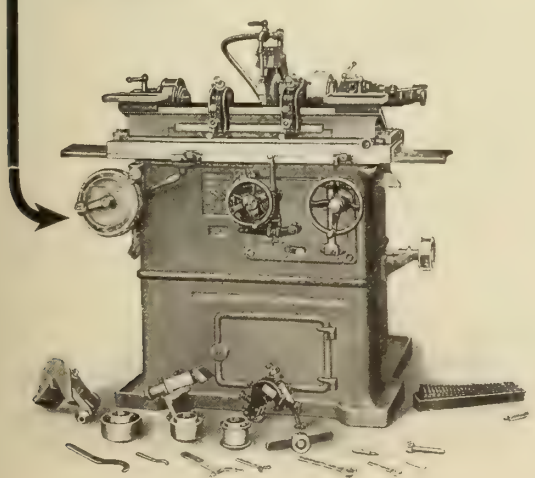
## Entire Control of Work Speed and Table Traverse From a Single Point

The new method of controlling the rotation of work and the rate of table travel on our smaller sizes of grinding machines makes it very easy for the operator to secure the right combination of speeds and feeds. The three levers around the dial are within easy reach of the operator's left hand. One controls the work speed, the other the table travel, while the long lever behind the dial will instantly start or stop both work and table simultaneously without stopping the grinding wheel.





## No. 10 Plain Grinding Machine

is equipped with this rapid control feature. The proper lever is moved around the dial until the desired speed or feed is obtained, figures on the dials indicating the rates. The increase in speed or feed is gradual, not by jumps. Faster production and higher quality of work are the direct result of the use of this convenient operating feature.

Let us send you a circular on this and other features of this machine.

Capacity of machine, to 6" in diameter and 20" long.

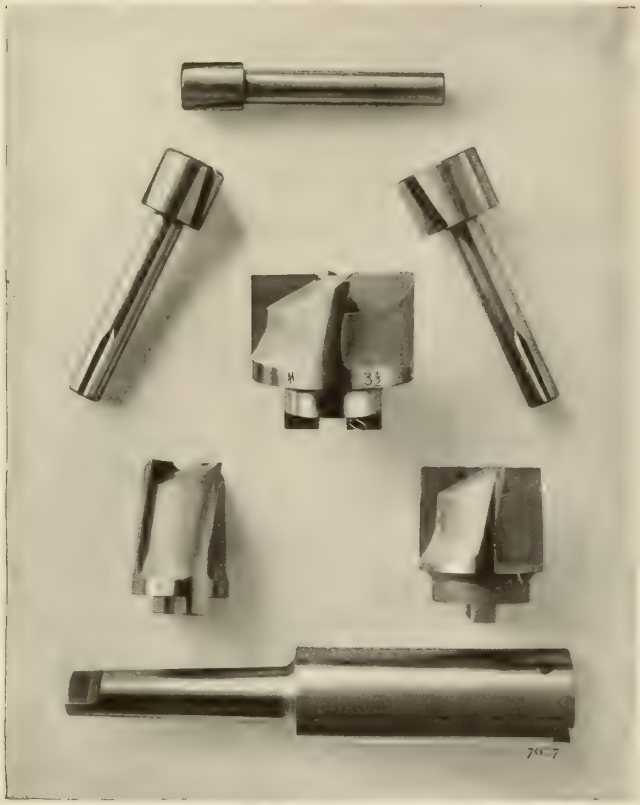
# Make Your Own Combination



For every counterboring job you can make up immediately the right combination of holder, cutter and guide if your tool-room is equipped with

## P. & W. Interchangeable Cutter Counterbores

Holders, Cutters and Guides furnished in wide range of sizes.

### Holders

End of holder is milled to receive the driving lug of the cutter and there is also a hole and set screw to accommodate the shank of the guides.

### Guides

Are of hardened tool steel. They are held in place by means of a set screw in the holder engaging a V slot in the shank of the guide.

### Cutters

Are furnished of either carbon or high-speed steel. The shank of the guide passes through the hole in the cutter and the shoulder between the guide and its shank keeps the cutter in place. Cutters can be sharpened on the face and the guide is simply pushed further in the hole after grinding.

*Write for catalog "Small Tools" showing our complete line.*

# Making Shrapnel Cases

presents some interesting problems. A vast number of these busy little agents of destruction are now being turned out in Canada and United States for the war in Europe—a good percentage being machined by tools treated in

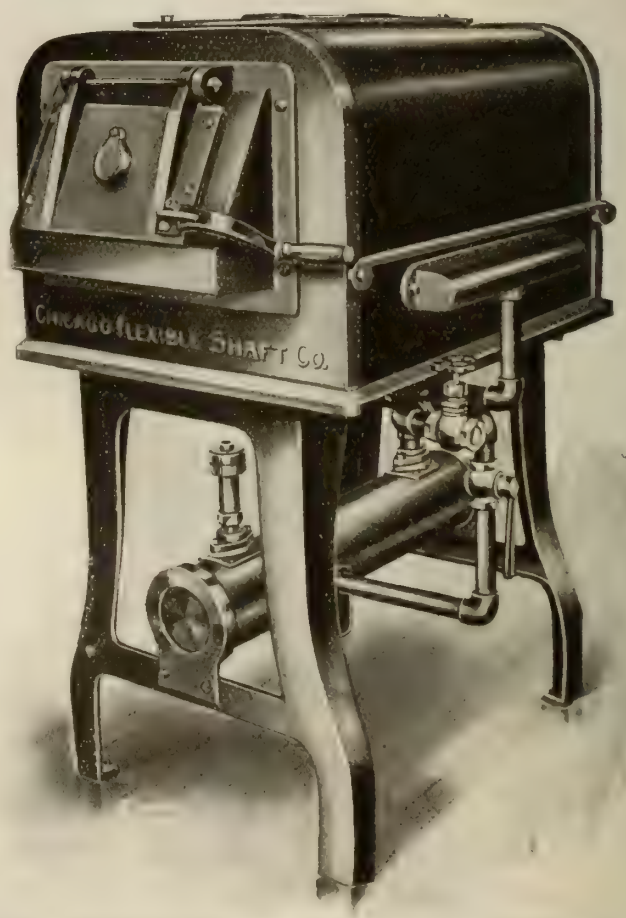
# STEWART GAS and OIL FURNACES

*"They Keep Your Tools Fit"*

The simple method of Heat Control enables the operator to get the **right** temperature for hardening or tempering the tool being treated and to hold it indefinitely.

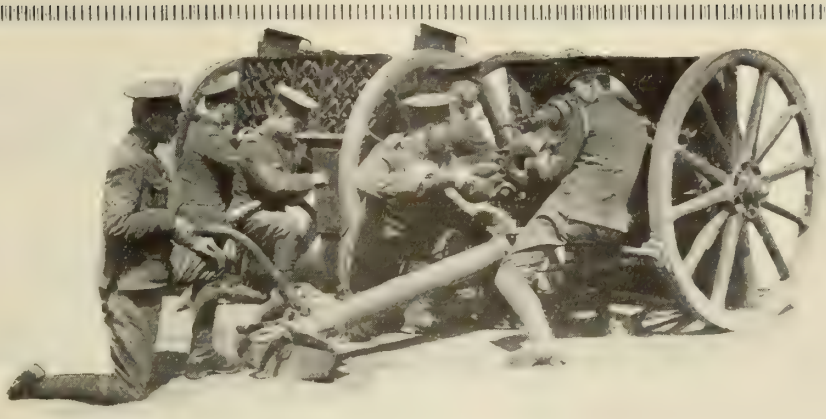
Modern shop practices have rendered obsolete the old guess-work of heating objects to be hardened in an open fire and dumping them into water when the manipulator "thought" they were at the right temperature.

**Put your Heat Treatment of metals on a scientific basis—it pays. Write us for details on the 100 odd types of STEWART FURNACES.**



**Chicago Flexible Shaft Company**

**210 to 230 Ontario St. Chicago, Ill.**



# Making Cartridge Cases

for rapid-fire guns requires some rather complex drawing operations together with a larger number of annealing treatments.

If your work includes similar operations—scores of Canadian plants are devoting their attention to making munitions of war.

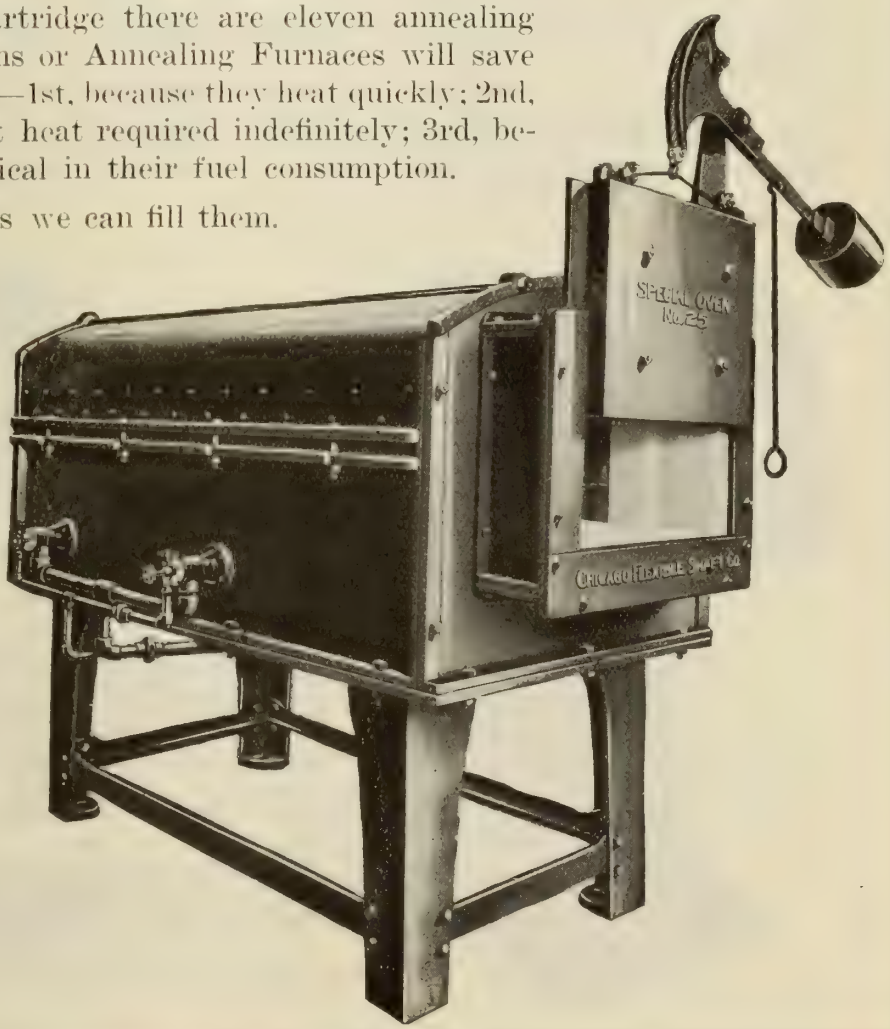
# STEWART GAS and OIL FURNACES

## Will Save You Money on Them

In the making of a 6-in. cartridge there are eleven annealing operations and Stewart Ovens or Annealing Furnaces will save money on every one of them—1st, because they heat quickly; 2nd, because they hold the exact heat required indefinitely; 3rd, because they are very economical in their fuel consumption.

Whatever your requirements we can fill them.

Besides our standard types we are well equipped to design and build furnaces to handle any special requirements in the heat treatment of metals.

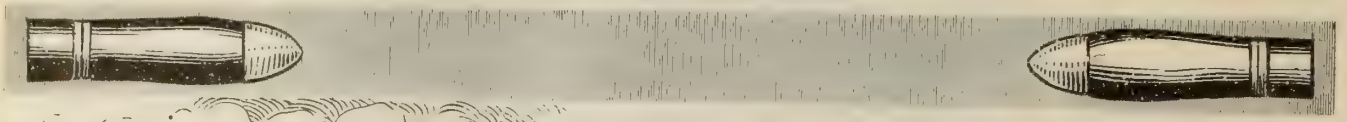


### We Offer

to prove every statement at our own expense. We will send any Stewart furnace you may select for a thirty days' FREE trial. Don't pay a cent unless it lives up to the guarantee. Write for details.

**Chicago Flexible Shaft Company**

**210 to 230 Ontario St., Chicago, Ill.**



# $5,000,000.00 per Day

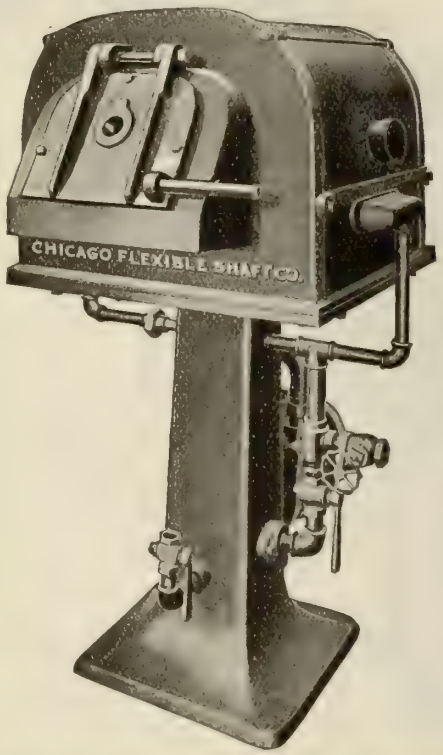
and more is the estimated amount being spent on ammunition alone by the warring powers. Much of it is for projectiles, for this is the War of a vast number of shells, especially shrapnel.

Those firms whose plants are equipped with

# STEWART GAS and OIL FURNACES

find themselves—as usual—in a better position to handle the fast, accurate machining required by these foreign orders.

They heat their forgings quickly, their case-hardening and annealing jobs are done economically and their tools are hardened and tempered with an accuracy impossible to obtain in a coal or coke fire.



"The life of a tool depends on its temper" and the Stewart No. 1 oven shown here has proved useful in prolonging the life of all sorts of cutters and dies. It develops the required heat quickly and holds it indefinitely at any degree of intensity—a characteristic of Stewart furnaces.

**Whatever your requirements we make, or will make, a furnace to handle them economically. Write today for our instructive Furnace Booklet.**

## Chicago Flexible Shaft Co.

**210 to 230 Ontario St. Chicago, Illinois**

*The advertiser would like to know where you saw his advertisement—tell him.*

# Higher Tool Efficiency

—the ambition of every up-to-the-minute foreman—has been achieved in more than 1,000 shops in Canada and the United States through the installation of the

## STEWART Special Combination FURNACE

It will handle all the heating operations possible to an oven, crucible, and forge-furnace in the most convenient and economical manner. The Special Combination offers a considerable saving in time, space and money, and will increase the efficiency of your tool room to a notable extent.

Stewart Furnaces have proven themselves without equal in the heat-treating of metals. They will maintain a certain temperature for an indefinite period and will harden or anneal your work exactly as you want it.

Whatever your requirements in the heat-treatment of metals—case-hardening or hardening of tools and dies, annealing, cyanide hardening, metal melting, brazing, or forging, there is a Stewart Furnace especially designed to handle the work in the most effective and economical way.

We have some interesting information for you—especially if you are manufacturing war materials. Put your heat-treatment problems up to Stewart Engineers. They will advise you free.

**Your correspondence is invited.**

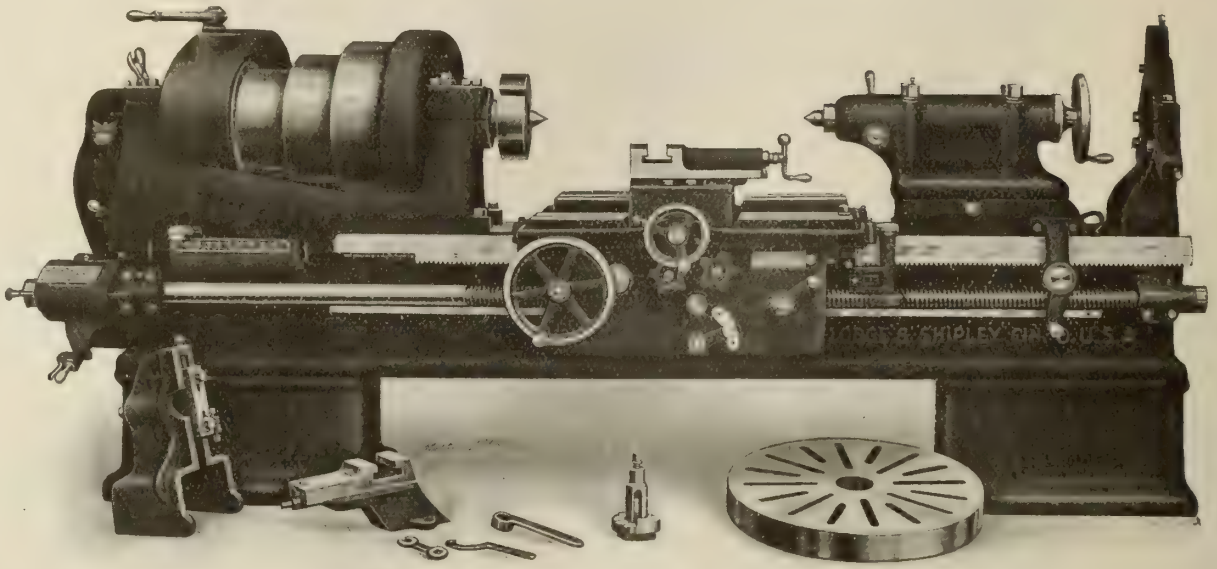
# For All Classes of Projectile Turning



24" Three-step Cone Head Engine Lathe.

For turning shrapnel cases, and for the final finishing operation on the assembled shell, we are furnishing quantities of 14", 16" and 18" lathes.

Lyddite and other high explosive shells are commonly made in larger calibre than shrapnel and require correspondingly heavier lathes for their manufacture. We are supplying lathes from 18" to 48" swing for manufacturing the various sizes of the heavier shells.

We manufacture lathes with Three-step and Five-step Cone Head and with Single Pulley Head. Special manufacturing equipment can be furnished with any.

*We have to-day in stock, in Canada, for immediate shipment, subject to prior sales:*

1—16" x 8' *Three-step Cone Head Engine Lathe.*
1—14" x 6' *Three-step Cone Head Engine Lathe.*
1—14" x 6' *Five-step Cone Head Engine Lathe.*

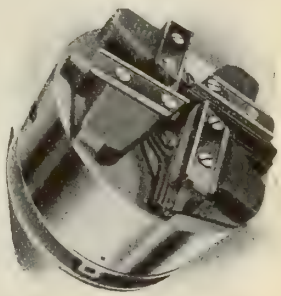
# In Scientific Selection The Landis Die Predominates



Because,—

The length of the chasers increases its life from ten to twenty times that of the hobbed die.

The line contact the chasers have with the work minimizes the friction at the cutting edges and permits of a much higher cutting speed.

Of the interchangeability of the chasers, which means any one or more of a set can be replaced without renewing the entire die.

Of the right and left hand threading with the same set of dies, a feature accomplished by grinding the opposite ends of the chasers and using right and left hand chaser holders.

Of the uniform hardness of the chasers, which makes it unnecessary to anneal, hob or retemper the die.

# PYROMETERS FOR SHELL ANNEALING FURNACES

## BRISTOL'S ELECTRIC PYROMETERS

Bristol's Electric Pyrometers are used extensively in connection with furnaces for annealing brass.

In December a Canadian concern placed orders for fourteen Combination Indicating and Recording Units of Bristol Electric Pyrometers similar to the combination unit shown in the above illustration. This includes the Indicating Instrument for the furnace operator at his place of duty and the Recording Instrument for the Superintendent or Foreman in his office.

**IN DRAWING SHELLS**

it is especially important to have the brass accurately annealed at certain temperatures at various stages of the process and to guide this heat treatment, the annealing furnace should be equipped with Bristol Pyrometers.

## BRISTOL'S RECORDERS

Every baking enamel oven should be equipped with Bristol Recording Thermometers. In other processes of the manufacture of materials used in shells Bristol Recording Thermometers are valuable to help in securing and maintaining uniformly the accurate temperatures. Bristol Recorders help the Superintendent or Manager to maintain uniformly efficient operating conditions.

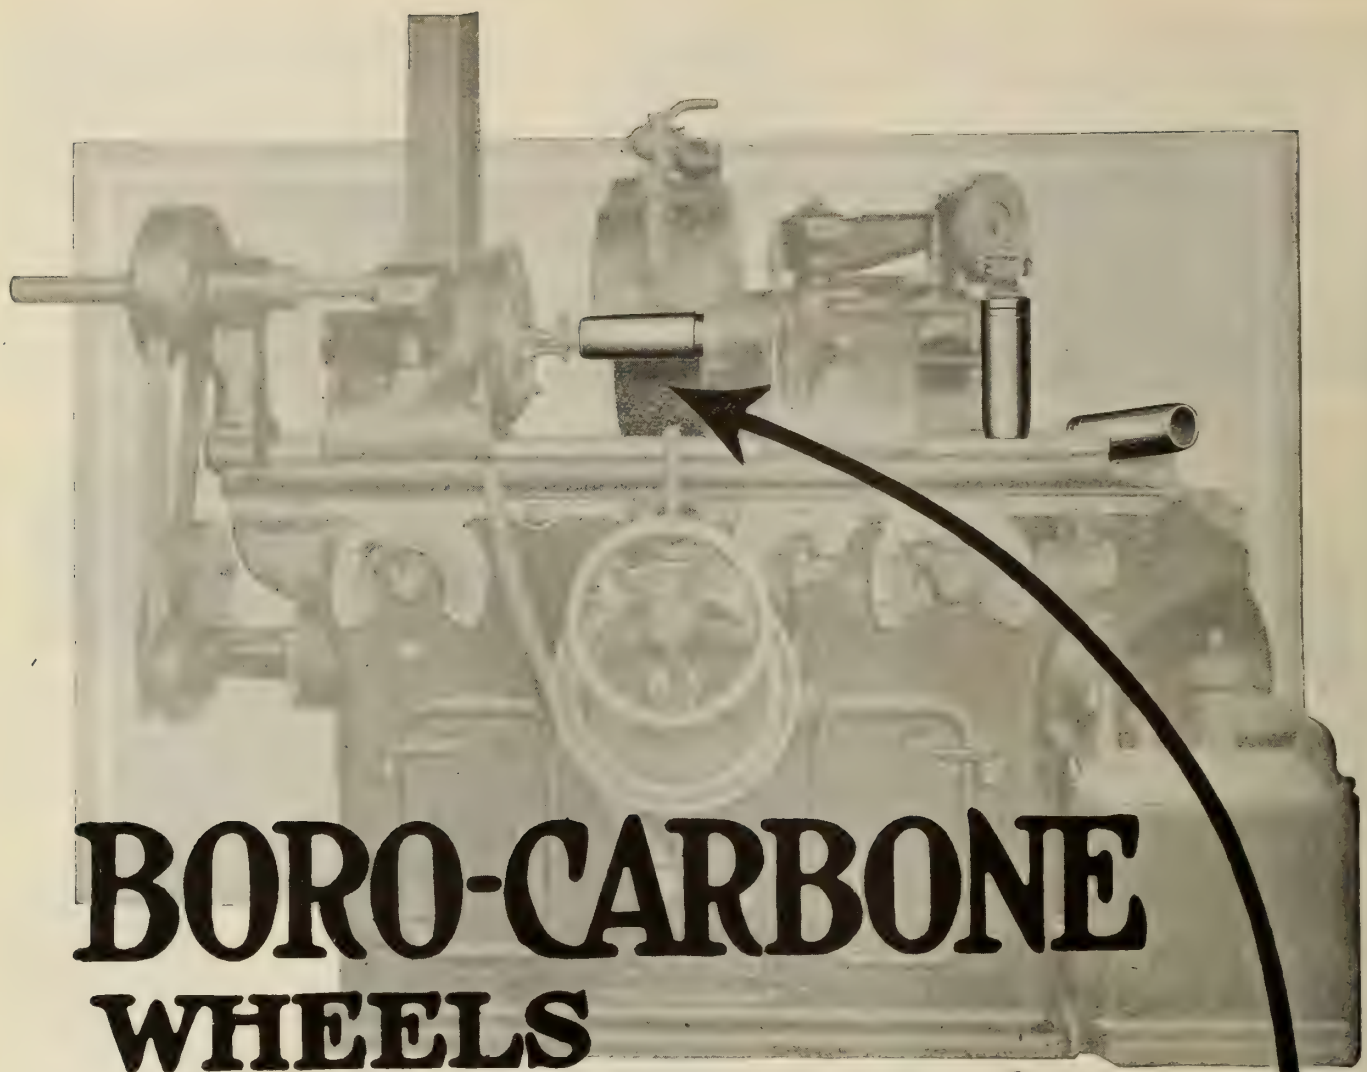
"ABC" Vertical Enclosed Self-Oiling Steam Engine, a very high-speed, high-efficiency engine, especially adapted for direct connection to Fans, Centrifugal Pump, Stokers, Generators, etc.

"Sirocco" System of Heating, Ventilating, Cooling and Drying, installed in Factory Building.

Detroit Tilting Steam Trap built in Return-Separating-Vacuum and Condensing Types. Used for automatically returning condensation from steam lines directly to boiler without pumping.

"Sirocco" Mechanical Draft Fan supplying draft to two of the largest boilers in the world—2,365 H.P. each.



# BORO-CARBONE WHEELS *for Shrapnel!*

ABRASIVE WHEELS made of BORO-CARBONE are ideal for shrapnel grinding. They have proved their superiority beyond a doubt, because they are fast cutting, cool cutting, uniform in grade, and produce accurate work in the least possible time.

Why not give us a chance to show *YOU* results? That's what you're looking for. We've done it for others.

Write us for more information about BORO-CARBONE and what it will do for your *particular* grinding operations.

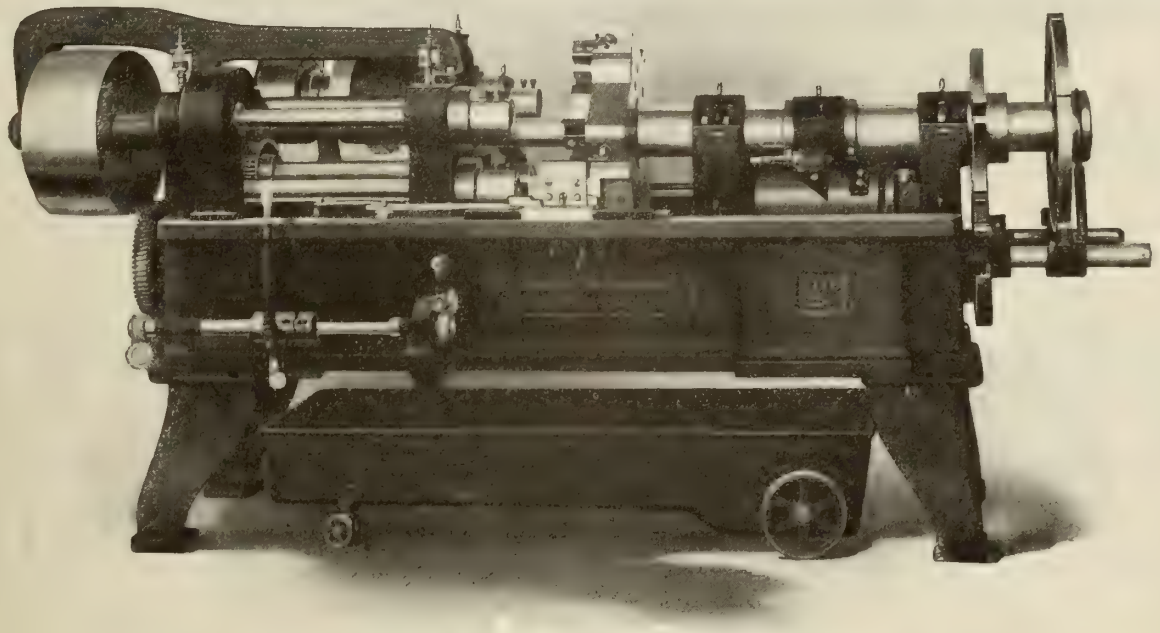
# Automatics on Shrapnel!

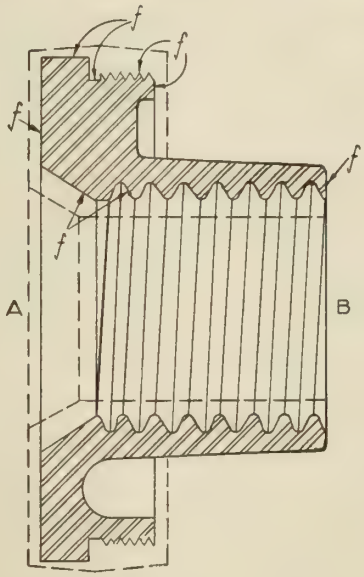


## 43 ADAPTERS PER HOUR!

***Labor Cost:***
**70 CENTS PER 100**

This Shrapnel Head Adapter is machined *complete* at two settings in Size 24 Automatic Four Spindle Single Head Chucking Machine.

Outline of rough blank is indicated by dotted line on drawing.



***Material:***
**STEEL FORGING**

OPERATIONS:

End A—Bored; Tapered; Faced and Tapped at the rate of 60 pieces per hour.

End B—Turned on two diameters; Faced; Under-cut and Threaded at the rate of 150 pieces per hour, while held on threaded arbors.

This production is impossible except on Automatic Multiple-Spindle Chucking Machines and there's but one such machine made—***the "New Britain."***

***Single Head Machines in Four Sizes***

If you contemplate the purchase of new equipment for shrapnel or any product requiring similar operations, it will pay you to investigate the New Britain's possibilities.

***Double Head Machines in Three Sizes***

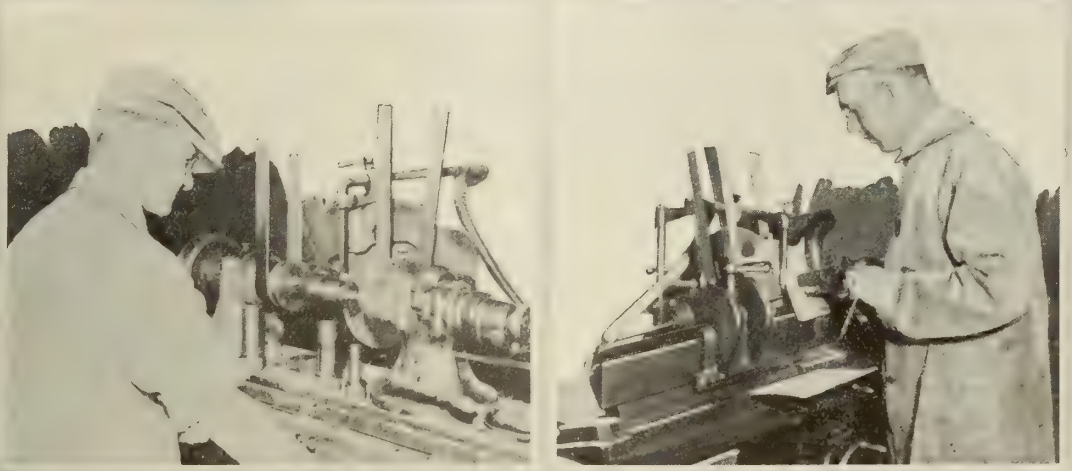
# True Grinding Economy



CARBORUNDUM SERVICE MEN AT WORK

The way to show true grinding economy is to decrease grinding costs and to increase grinding production. Grinding whee s that glaze, cut slowly or lose their shape and do not show proper length of life are costly—next to useless—unnecessary. You can get just the *Right Wheels in the Right Place*—wheels that cut free, clean and fast, of just the right grit and grade to meet your every grinding condition—wheels that will decrease grinding costs, increase and better production.

TRUE GRINDING ECONOMY COMES WITH CARBORUNDUM SERVICE

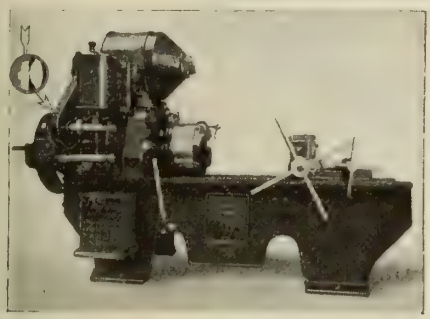
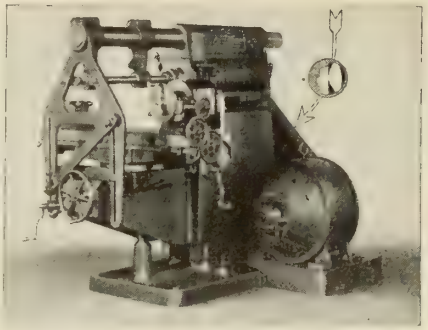
# MORSE Silent Chains

***For machine tools and other shop and factory applications,***

MORSE Silent Chains are the ideal method of transmitting power, offering a drive, positive like gearing but without the noise, flexible like belting but without the slip. They are more efficient than either belting or gearing.



Morse Chain Driven Landis Bolt Cutter.



Morse Chain Driven Cincinnati Milling Machine.

Say to the builder "I want a MORSE Chain Driven Machine" and you will get a machine that will do more work because the chain gets more power to it. The motor will require less attention and repair because the chain, run slack, absorbs the shocks of starting, stopping, and cutting into hard spots.

## Logic

*WE could not have lived through twenty years of competition with a product only different from all others.*

*Being the one different chain, the MORSE Silent Chain had to be better at first, and we maintain that distinction today.*

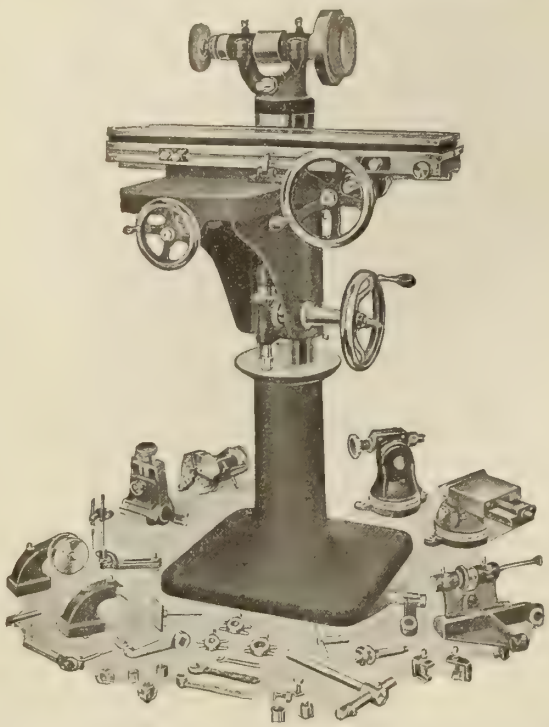
The *Greenfield*



## A Complete Universal Grinding Outfit

This machine, with the equipment furnished with it, is capable of handling a large variety of grinding work; the sharpening of the numberless shapes of milling cutters, reamers, countersinks and counterbores; or the many small jobs of cylindrical, surface and internal grinding that are continually arising in the toolroom.

It is mechanically all that you would expect in a machine costing a lot more money. You cannot beat a "Greenfield" for any grinding within its range.

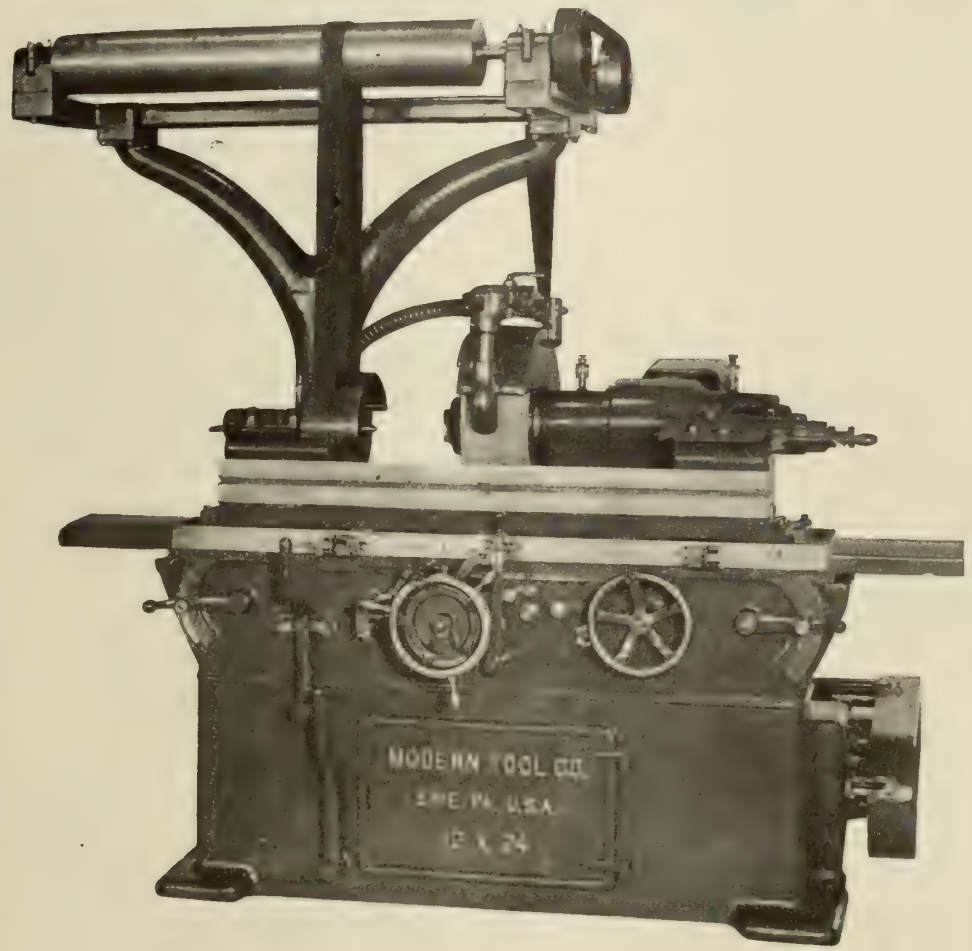
# Finishing Shrapnel Shells

ON THE

## "MODERN" 12" x 24" Self-Contained Grinding Machine



## The heaviest, most powerful and efficient Standard Grinding Machine made for Shell work

The "MODERN" 12" x 24" Grinding Machine is especially adapted for grinding Shrapnel Shells. The Machine is more than guaranteed, it is demonstrated. Large diameter, wide face wheel, with powerful drive—automatic feed without traversing the table—absolute central control of all levers and hand wheels—single constant speed drive.

We have recently sold a large number of these Machines in Canada, completely equipped for Shrapnel Work. Ask the man who is using the "MODERN."

The large manufacturer appreciates the production possible on this Machine. Machine comes equipped for all classes of straight and taper cylindrical work.

# AMMUNITION

**We have for immediate delivery the following machine tools, carefully selected, rebuilt and in first-class condition, many being particularly adapted to the manufacture of shrapnel:—**

**BORING MILLS.**

1—6″ Horizontal Niles, table type.
1—4″ Horizontal Niles, table type.
1—No. 21 Lucas Table Type.
1—No. 1 Lucas Table Type.
1—34″ Colburn with plain table, turret head, vertical.
1—24″ Vertical Turret Lathe.
1—36″ Bullard Vertical Turret Lathe.
1—72″ Pond Friction Feed Boring Mill.
1—16′ Pond Double Head Boring Mill.

**DRILLS, MULTIPLE.**

1—10-Spindle Baush, 1″ capacity.
1—No. 43 Gardam 8-Spindle, ⅝″ capacity.
1—8-Spindle Moline Rail Drill, ¾″ capacity

**DRILLS, UPRIGHT.**

2—20″ Baker, Style F.
1—20″ Two Spindle Mechanic Wheel and Lever Feed.
1—4-Spindle Barnes Power Feed.
1—24″ Barnes Sliding Head.
1—24″ Cincinnati, late model, Sliding Head.
1—32″ Cincinnati Sliding Head.
1—Foote-Burt Special High Speed Drill Press, tapping attachment.
1—Foote-Burt High Speed Drill Press, geared feed.
1—34″ Barnes Sliding Head.
1—40″ Aurora Sliding Head.

**DRILLS, RADIAL.**

1—2′ Fosdick Plain Cone Drive.
1—2½′ Fosdick Plain Cone Drive.
1—3′ Dreses & Miller Cone Drive Geared Feed.
1—3′ Prentiss Geared Feed.
1—4′ Baush Plain Radial Drill.
1—4′ Pond Heavy Plain Radial.
1—8′ Niles Heavy Plain Radial without board support.

**DRILLS, SENSITIVE AND MULTIPLE.**

**Drills, Sensitive.**
1—10″ Myers Plain Bench Drill.
1—10″ Barnes Friction Bench Drill.
1—12″ 4-Spindle Barr Sensitive Drill.
1—4-Spindle Pratt Whitney Sensitive Drill.
1—14″ Foote-Burt Two Spindle Drill Press.
1—14″ Foote-Burt 6-Spindle Drill Press.
1—14″ Foote-Burt 4-Spindle Drill Press.
3—14″ Barr Sensitive Drill Presses.

**GEAR CUTTERS.**

1—26″ Brown & Sharpe Plain Spur Gear Cutter.
1—33″ Gould & Eberhardt Spur Gear Cutter.
1—40″ Flather Plain Spur Gear Cutter.
1—36 x 12 Becker Brainard Spur & Bevel Gear Cutter.
1—48 x 12 Gould & Eberhardt Spur Gear Cutter.
1—24″ Fellows Gear Shaper.
3—36″ Fellows Gear Shapers.

**HAMMERS.**

400-lb. Morgan Single Frame Steam Hammer.
2000-lb. Single Frame Bement Miles.
3300-lb. Single Frame Bement Miles.
1500-lb. Single Frame Bement Miles.

**GRINDERS.**

1—No. 1 Leland & Falconer Wet Tool Grinder.
1—No. 11 Brown & Sharpe Plain Grinder.
1—6 x 32 Plain Grinder.
1—No. 200 and No. 210 Heald Ring Grinders.
1—No. 3 Leblond Universal Tool & Cutter Grinder.
1—10 x 36 Landis Plain Grinder.
1—12 x 42 Landis Plain Grinder.
1—Style Yankee Wet Drill Grinder.
1—No. 2 Worcester Drill Grinder.
1—P & O Yankee Drill Grinder.

**MILLING MACHINES.**

1—No. 0 Brown & Sharpe Plain Miller.
1—No. 0 Kempsmith Plain Milling Machine.
1—No. 21 Kempsmith Milling Machine.
5—No. 32 Kempsmith Lincoln Type Milling Machines.
1—No. 13 Lincoln Type Pratt Whitney Milling Machine.
1—No. 2 Brown & Sharpe Plain Cone Drive Heavy Miller.
1—No. 2 Brown & Sharpe Universal Milling Machine.
1—No. 3 Cincinnati Plain Belt Feed Milling Machine.
1—No. 2 LeBlond Milling Machine.
1—No. 1½ LeBlond Plain Milling Machine.
1—No. 3 LeBlond All Power Feed Milling Machine.
4—No. 3 Brown & Sharpe Milling Machines (Plain.)
1—No. 13 Brown & Sharpe Lincoln Type Milling Machine.
1—No. 5 Becker Brainard Milling Machine.
1—No. 5B Becker Brainard Vertical Milling Machine.
1—No. 4 Blake & Johnson Vertical Milling Machine.

**SHAPERS.**

1—15″ Hendey Friction Shaper.
1—18″ Steptoe Single Geared Crank Shaper.
1—16″ Cincinnati Back Geared Crank Shaper.
1—20″ Kelley Back Geared Crank Shaper.
1—20″ Smith & Mills Double Back Geared Crank Shaper.
1—22″ Smith & Mills Shifting Belt Shaper.
1—24″ Walcott Back Geared Crank Shaper.
1—24″ Walcott Shifting Belt Shaper.

**PLANERS.**

1—16 x 16 x 4′ Hendey Single Head Planer.
1—22 x 22 x 4′ New Haven Planer.
1—24 x 24 x 6′ Gray Single Head Planer.
1—24 x 24 x 8′ Powell Planer.
1—28 x 5′ New Haven Planer.
1—24 x 6′ Pease Planer.
1—30 x 30 x 10′ Whitcomb Planer.
1—60 x 18′ Pond Double Head Planer.
1—38 x 38 x 10′ New Haven Double Head Planer.
1—72 x 24′ Pond Double Head Planer.
1—12 x 26′ Pond, four heads.

**SLOTTERS.**

1—52″ Hewes & Phillips Slotter.
1—30″ Pond Slotter.
1—24″ Hewes & Phillips Slotter.

**TURRET LATHES AND SCREW MACHINES.**

1—1″ Pratt & Whitney Screw Machine with cut-off rest and automatic chuck.
1—⅞ x 4 Brown & Sharpe Screw Machine.
1—No. 2 Warner & Swasey Wire Feed Automatic Chuck.
1—No. 3 Bardons & Oliver Wire Feed Automatic Chuck.
1—2 x 24 Jones & Lamson Sliding Head.
1—2 x 24 Jones & Lamson Cone Head.
1—1½″ Dreses Wire Feed Screw Machine.
2—3 x 36 Jones & Lamson Sliding Head Turret Lathes.
1—24″ Davis Chucking Machine.
1—21″ Gisholt Turret Lathe.
1—No. 2 Fosdick Plain Head Turret Lathe.
1—No. 4 Foster Turret Lathe, power cross feed and power feed to turret slide.
1—No. 6 Foster Turret Lathe, power cross feed and power feed to turret slide.
1—24 x 10 Lodge & Shipley Screw Machine.
1—7⅞ Cleveland Automatic.
1—Gridley Automatic Piston Ring Machine.
4—Potter & Johnson 6½ x 18″ Automatic Turret Lathes.

**MISCELLANEOUS.**

1—Wood Band Saw, 36″.
1—Cut-off Machine.
Cold Saws.
Keyseaters.
Centering Machine.
Oil Separator.

# One-Half Inch of Wheel Wear in Grinding 432 Cams

In the operation cited above the cams were 1¾" dia., ⅜" wide, with 3/32" to ⅛" stock to remove. There were 12 cams on each camshaft. The wheel is fed in straight without traverse.

Nothing exceptional in that record—just the good average record that shows what constitutes satisfactory service—good production with small wheel wear.

A grinding wheel must stand up in cam grinding to grind to correct contour. You can only use about one inch (say from 18" dia. to 17" dia.) of wheel in cam grinding before you have to take the wheel off. Make that inch count by using

## NORTON Alundum Wheels

to obtain long life, high production and good finish.

Cam grinding frequently brings up the question—"What is the best wheel?" Can we help you make cam grinding profitable?

# ACME

## Cutting Lubricant
### used on Shrapnel Shells

The above photograph shows a shrapnel shell being machined on an Engine Lathe with Acme Cutting Lubricant.

Keeps the tools cool, furnishes sufficient lubrication, prevents excessive wear.

Works equally as well on Turret Lathes, Milling Machines and Bolt Cutters.

Leading Manufacturers use it on shell work in preference to oil; costs less and increases production.

**We solicit your trial order and will ship on thirty days' approval, subject to practical test.**

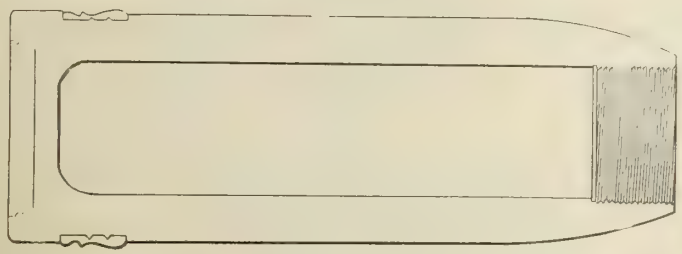
# Murchey Collapsing Taps on Lyddite Shells



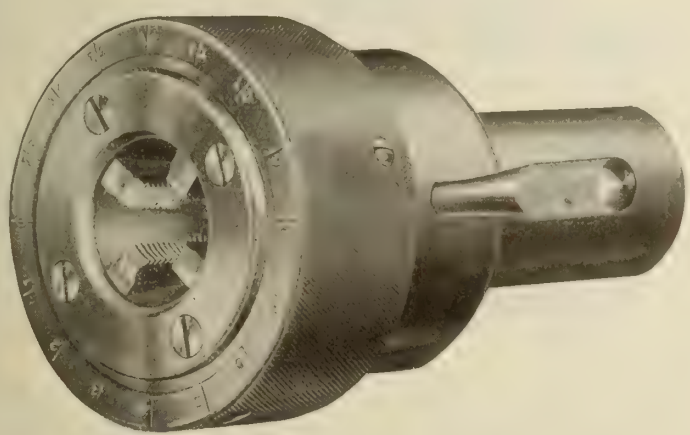
**The Murchey Lever Handle Type**

## Fall In! Attention!

Every manufacturer of Lyddite Shells needs our Collapsing Taps, as this work requires a long, accurate thread. Tapered threads will cause rejection.

Murchey Taps, on account of simple design, few parts, insure accurate threads. They cut the time in half, with no chance of spoiling threads. A majority of Canadian Shell makers use Murchey Taps and Dies.

*Write for catalogue or send blue print of work.*



### Brass Manufacturers'

costs of making brass for shells are materially reduced by using Murchey Collapsing Taps and

### Automatic Opening Dies

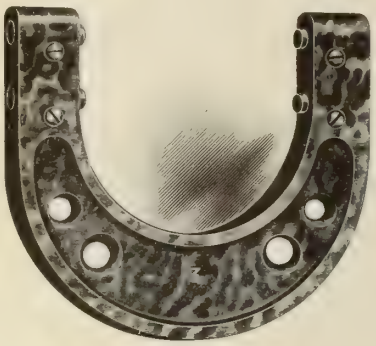
**No reversing. No stripped threads.** We guarantee our chasers will not become bell-mouthed and cut taper threads.

**MURCHEY tools are adapted to all kinds of machines. Specify Murchey Taps and Dies on your machine orders and avoid future trouble.**

## MURCHEY MACHINE & TOOL COMPANY

**34 Porter St., Detroit, Michigan**

# Screw-Cutting Tools and Gauges for Projectiles



## Wells Crescent Cylindrical Limit Gauges

are being very largely used for measuring the outside diameters of shells.

With these gauges only one testing—instead of two—is necessary. The minimum limits are set immediately back of the maximum limits. The shell should pass the first points but not the second pair.

These gauges are standard and can be delivered—set to specified limits—very promptly.

## Wells Thread Limit Gauges

are similar in construction to the cylindrical gauges except that they are furnished with cone points carefully ground to the angle of the thread wall.

Prompt delivery.

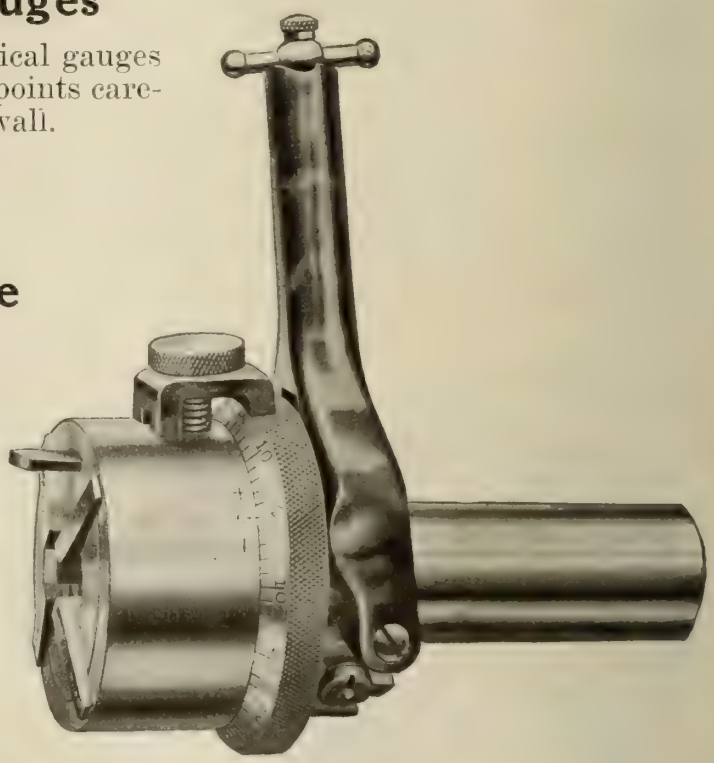
**Gauge catalogue?**

## The Wells Self-Opening Die

is a wonder for quick and accurate threading.

The construction of the W. S. O. D. is **right.** The long chasers have a bearing for their entire length and width against the sides of the slots in the solid steel body, and are supported directly back of the cutting teeth by the hardened steel shell. For this reason the die stands up to the work and the chasers cannot wear to become loose and inaccurate as is the case so often with the cam-actuated type of die head.

**Send for booklet showing different models and specifications.**



## Special Taps

Our facilities have been tried and proven. We have helped many a manufacturer out of his threading difficulties by meeting his needs for specials. Many years of excelling in the art of tap and die making is responsible for our success.

# A PENNY SAVED IS TEN CENTS EARNED

**A penny EARNED is one cent GROSS profit. But a penny SAVED is ALL NET. That's why it pays to save.**

For a source of unusual savings, look into the question of Files. See if your men are using **inefficient** files. Working with worn files that have ceased to do good work.

Every such file you find in service may mean many dollars lost. For beyond a certain point, a file's best efficiency is gone. It then requires so much time to perform a given task, that it's real ECONOMY to throw it away. To replace it with a new file—at once. What you thus save in time and labor would pay for many new files of the "Famous Five":

## KEARNEY & FOOT
## GREAT WESTERN
## AMERICAN
## ARCADE
## GLOBE

***(Made in Canada)***

They reflect the facilities of 5 great plants. The precision of costly automatic machinery. The economy of a 60,000,000 yearly output. The uniformity of complete control in every process. The perfection of rigid inspections and practical tests. The wide range of 4,000 different patterns. The unvarying high quality that won—and now holds 90% of Canada's file trade.

The "Famous Five" will save money in your shop if you give them a single trial. They pay their way many times over in better work at lower cost.

*"File Filosophy" and our Catalog should be on your desk. Write for THEM to-day.*

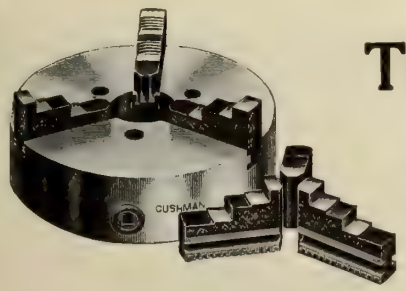
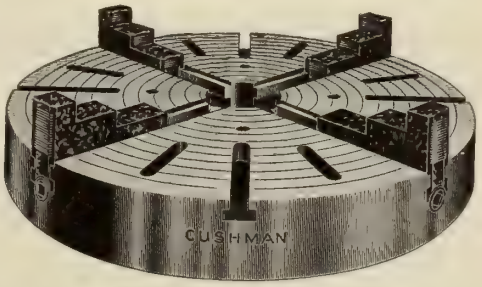
## Lathe Chucks, Drill Chucks, Centering Chucks
## Portable Face Plate Jaws

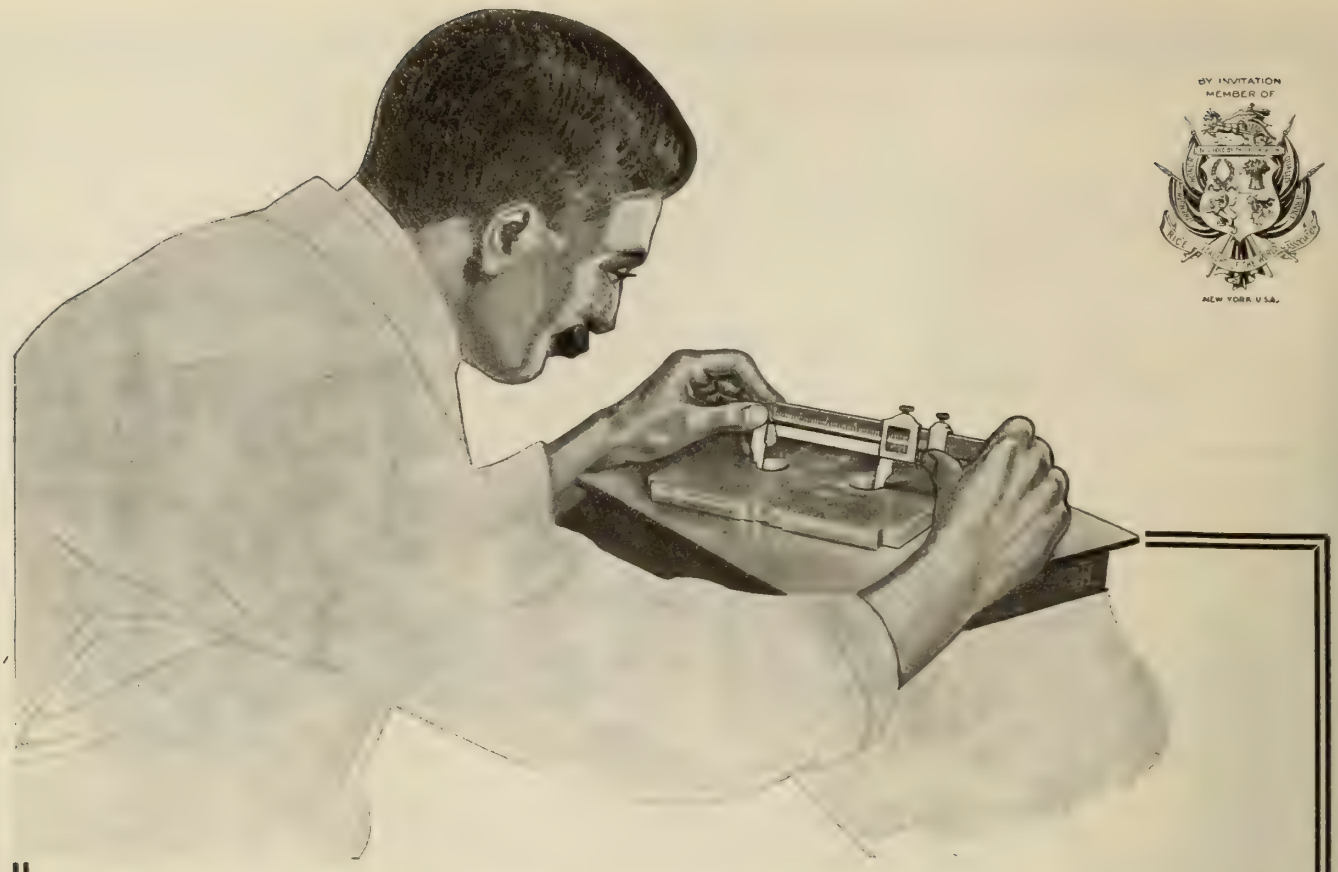
Our regular chucks are known as the heavy pattern, but we now have a new line called "Blue Line" Chucks, made entirely of steel.

Let us send you our catalog.



## The Cushman Chuck Co.
**HARTFORD**
**CONN., U.S.A.**





BY INVITATION MEMBER OF

# Starrett Vernier Calipers

## Where Used

Starrett Vernier Calipers should be used by high-grade machinists and toolmakers for accurate work on all measurements where a micrometer cannot be conveniently used. They are equally accurate for outside or inside measurements, and may be used on a wider range of work than can a micrometer.

## Superiority of Graduations

In using the vernier for readings up to .001 of an inch the accuracy of the measurements depends on the graduations of the instrument. The Starrett graduations are more accurate than those obtained by any other process—they are cleaner, finer, and sharper than on other instruments. Examination under a microscope will prove this assertion. Our secret etching process produces this result.

## In Plush-Lined Cases

To keep the vernier safe from rough handling and from contact with tools or other objects which might scratch it, we furnish with each instrument a plush-lined wooden case, very attractive and a perfect protection.

## Prices

The prices for Starrett Vernier Calipers, including cases, are as follows:

4″—$13.00
6″— 15.00
9″— 18.00
12″— 20.00
24″— 25.00

Send for free catalog No. 203, describing 2100 styles and sizes of fine tools.

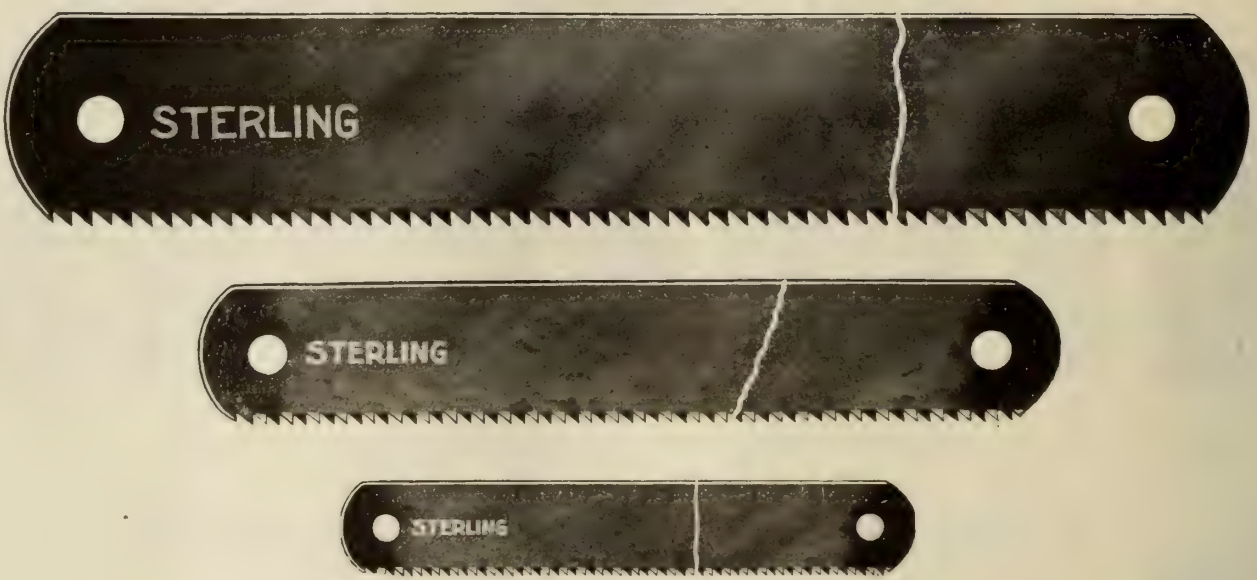
# "STERLING"

## Hack Saw Blades



Made in lengths from 6 in. to 36 in., and in widths from ½ in. to 2 in., for all sizes of power hack saw machines, also hand frames, and in gauges and pitches suitable for cutting all kinds of metal.

The material in these blades is the very last word in the steel makers' craft; added to this, the correct mechanical construction, also very special heat treatment given to the steel, go to make up the highest efficiency in a hack saw blade.

Regular "STERLING" Blades, in both power machine and hand frame sizes, are hardened throughout, and drawn to a degree to combine toughness with hardness.

"STERLING" Blades for hand frames are also made with a double hard edge, the greater part of centre being left soft, making them strong and rigid as well as flexible.

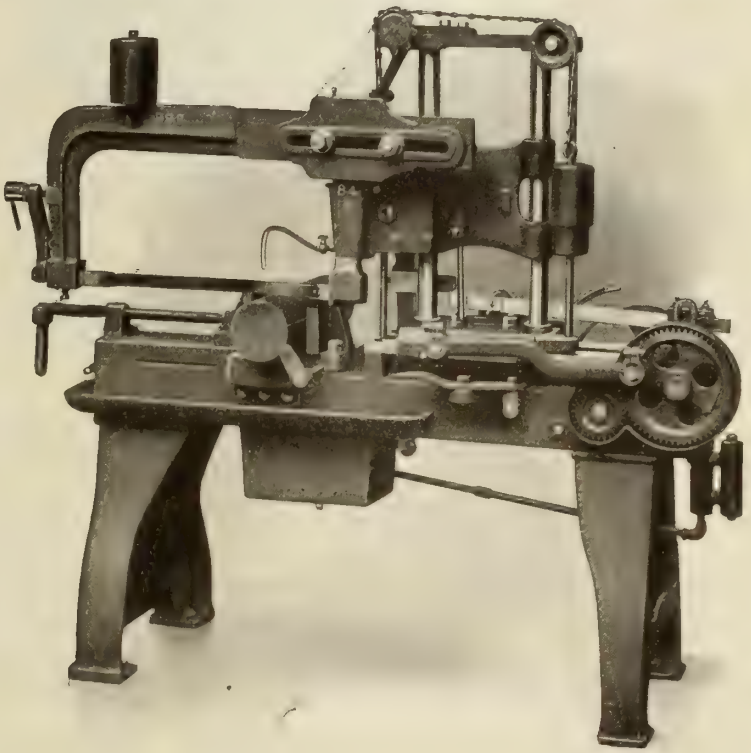
*The advertiser would like to know where you saw his advertisement—tell him.*

# "STERLING"

## Power Hack Saw Machines



The above illustration shows the latest improved High Speed Hack Saw Machine. The construction of this machine will instantly appeal to the trained mechanical eye. It combines all features necessary for a high speed metal-cutting saw.

Adjustments may be made for different lengths of blades; at the same time the solidity of a solid frame has been preserved, as will be seen from cut.

Automatic lift being controlled by a cam, is a positive movement; nothing to get out of order.

The pump for water system is of the plunger type, is the simplest thing possible for this class of work and always positive.

All working parts are well and accurately machined, the proportion of metal for strength being well distributed.

To sum up, you have in the above combination a well-constructed and efficient metal-cutting saw, that should and will satisfy the most exacting.

# BACK TO THE SIMPLE LIFE

The biggest producers of shrapnel and other projectiles have learned the money-making advantages of the simple, single-purpose machine.

The lure of multiple cutting is dimmed by the time (and money) lost in the constant adjustment and resetting of tools. That may be all right for soft stock—but shrapnel stock is different.

Engine lathes, simple and rugged, are the wise man's solution of the turning problem—**We don't make them.**

**Our Plain Turret Machines are the proper tools for all boring operations—they have been designed especially for this work.**

Tell us what you want to do, and we will prove our point.

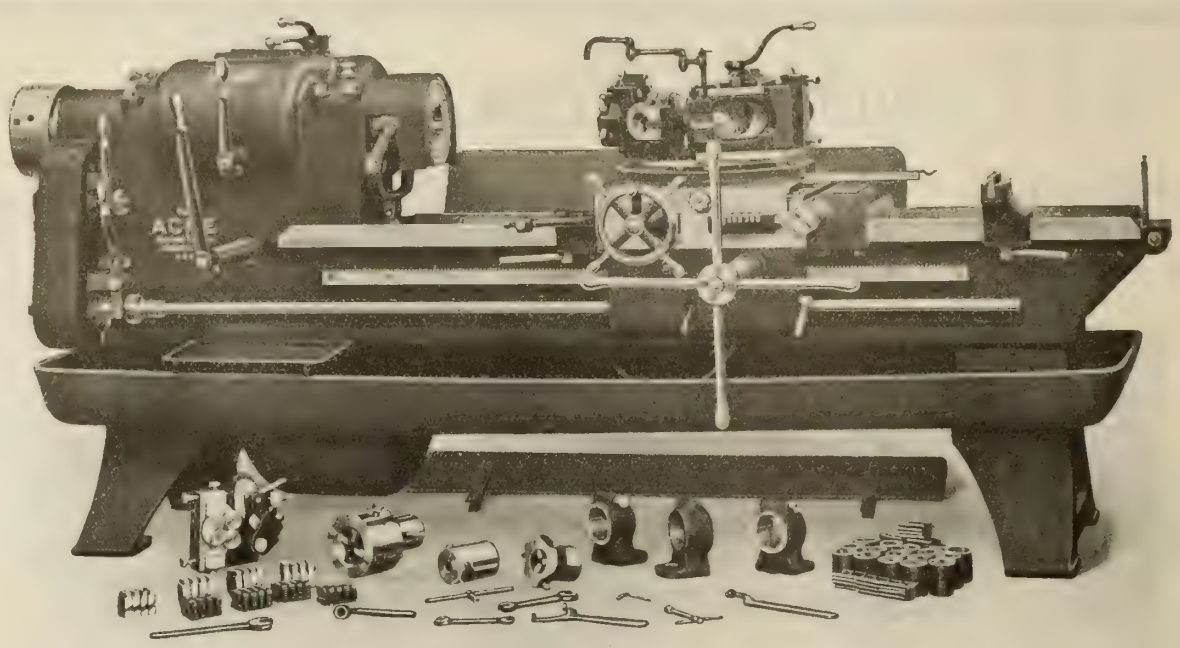
SPECIAL MACHINERY.



3¼" x 36" "Cincinnati Acme" Flat Turret Lathe—Equipped for Bar Work.

# CINCINNATI ACME FLAT TURRET LATHE

## Rigidity—Accuracy—Simplicity

These three features must be considered when buying a machine of this type, and you'll find that the "Cincinnati Acme" Flat Turret Lathe possesses all three—to the highest degree.

It is adaptable to both bar and chucking work. The maximum capacity for bar work is 3¼" diameter x 36" long, while all classes of chucking work up to 16" diameter can be machined.

It is splendidly built, strong and rigid, yet there's no useless material in it. The flat turret gives rigid tool support, and the tools required are very simple, most of them being standard.

The above illustration shows the machine equipped with a positive automatic chuck, which is specially designed to insure holding the work accurately and to give the greatest gripping power.

The wide range of work possible makes the machine a cost reducer worth investigating.

Every part of this machine is a meritorious point, and it will pay you to get all the details.

Our Machine Tool Dept. is fully conversant with the machinery and tool equipment necessary for the manufacture of both Shrapnel and Lyddite shells.

To meet the unprecedented demand for machinery of this nature we have arranged for a complete line of equipment to care for all requirements.

The press illustrated is one of our many lines, and is made at our Toronto Factory. It has a capacity of approximately 30 tons per cylinder.

## The Canadian Fairbanks-Morse Co., Limited

ST. JOHN MONTREAL QUEBEC OTTAWA TORONTO HAMILTON
WINNIPEG SASKATOON CALGARY EDMONTON VANCOUVER VICTORIA

Canada's Departmental House for Mechanical Goods

TOWARDS the middle of last year, Canada, in common with the United States, and, to a certain extent, other countries, was experiencing the reaction due to a long period of prosperity, with its consequent extravagances and more or less wild financial speculation. One after another, factories began to lay off men, work short time, and even to shut down. Then in August, like the fates, came the European war to change a condition of tight money and business depression into one of apparent hopelessness.

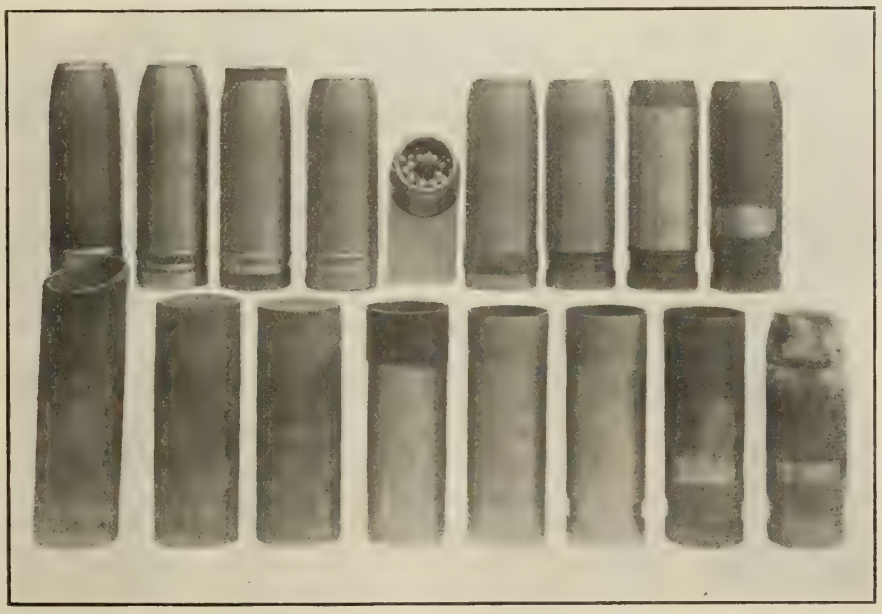
A more or less panicky situation developed, arising largely from the feeling of uncertainty as to our Empire's preparedness to protect its widespread territory, to maintain the freedom of the seas, to stem the progress of Germany's military machine, and help put a crimp in her long-time-cherished, all-conquering, but otherwise insane ambitions.

It was early noted, however, that, whatever the position from the land or strictly military viewpoint, with regard to sea power and sea control, "Britain ruled the Waves," and that although some little time must elapse before the various enemy raiders known to be afloat were driven to neutral ports or "Davy Jones Locker," trade and commerce would suffer otherwise little interruption. Intimation that the rush on Paris by the Huns had been permanently stemmed soon followed and served as it were to complete the assurance that the crisis had passed and that for industrial Canada the future motto would be that of capturing the enemy's trade. Broadcast publicity in the latter direction followed, but whether "what is everybody's business is nobody's business," or otherwise, results were nil, or at best disappointing.

### Capturing Enemy Trade.

In this respect Canada was no more guilty of what might be termed a sin of omission than the Old Land or than the United States, and this leads us to remark that, after all, the slogan "capture the enemy's trade," was to a large extent but an expression of our indignation at their procedure, and smacked of school boy action and retaliation. Superlative effort to capture at one swoop enemy trade abroad may be classed in the impossibility category so far as results are concerned, and business men began to realize this even before the warmth of their enthusiasm so kindled had wholly cooled. They realized that doors of opportunity were open which hitherto had not appealed to them with the like insistence and forcefulness but they further appreciated the fact that the work must needs be one of more or less nursed development. To this end our manufacturers are now applying themselves, and the achievement recorded in the brief space of a few months is satisfactory evidence that if enemy trade is not being captured, it is at least being systematically acquired.

Reference has already been made to our Empire preparedness for war and more particularly war on the gigantic scale on which that now raging is being waged. Our fleet, the men who designed, built, manned, operated and directed it, had been, were and are easily equal to every contingency, humanly speaking, likely to arise. In matters military the position was and has always been different. The maintenance of a standing army running into millions of men of all ranks and services had neither been found desirable nor necessary. In like manner, war munitions were not on tap on a stupendous scale. To meet the unique military situation created by an all-European war the call was made for both men and munitions in number and quantity easily and altogether unprecedented in our Empire history. The munitions of war being the feature with which we are at present dealing more particularly, it is sufficient to remark here that as regards the call for men, the British Isles have done themselves proudly, and, we in Canada, have not only made noble response, but as recent



SHELLS IN PROCESS FROM THE FORGING TO THE PRODUCT AS COMPLETED IN CANADA.

reports from the front only too plainly indicate, we, through our representatives there, are earning undying fame, the admiration of our friends, and have instilled into the hearts of our enemies the knowledge that we both know and are attending to our business, of whatever its nature may be at any moment.

### Canada's Response.

Little did Sir John French realize, when he gave utterance to the for-all-time memorable statement-request, for "shells, and shells, then more shells," in order to prosecute the war to its early and logical end, that Canada would play so important a part in placing these commodities at his disposal.

That our metal working industries have risen to the occasion is amply borne out by the peace-time variety-product plants featured in this issue as war-time producers of shrapnel and high explo-shells. More or less surprise is, however, being expressed - we should say simulated, rather — that "Canada's Response" has been so universally effective, and not a little credit is being appropriated by our American brethren for the achievement. It is claimed that for the most part we have in the past been devoid of enterprise, and that our manufacturers doted and were prone to converse on sport and recreation in business hours to an extent highly detrimental to the pursuit of commercial ascendancy. In a word, we are reputed to have been conservative, contented and easy going, and the fact that we have broken away from such a condition combination is being attributed to our sudden acquirement of the business energy of our American cousins.

Business and pleasure mate desirably, and either alone becomes nauseating if practiced without intermission. Our manufacturers have realized that, for a period, whole-hearted devotion is meantime necessary to the equipment of their plants and to the establishment of ways and means for smooth running to secure quality and quantity output of shells. They have at the moment no time, it is true, to tell of fishing successes or of the exploits of hunting expeditions, but long before the war is over they will catch many fish, kill many deer, resume their wonted attitude of good fellowship in talking sport and pleasure and withal be supplying the Allies from twenty-four-hour-day capacity plants, with shells in number far exceeding present efforts.

Of all the crafts represented in the prosecution of the war, that of engineering in its every aspect is dominant, and it is therefore only fair and giving "honor to whom honor is due," to give our metal working plant administrations the fullest degree credit for the native initiative and enterprise which has characterized them at this critical period of our national and Empire history.

## GUN ENDURANCE.

IMPORTANT as is the necessity that the Allies have a superabundance of shells of wide variety, sort and size, it is equally so that the gun provision for their effective and accurate discharge be adequate in every respect. Particularly, of course, is this supremely desirable in the matter of continuous bombardment of land forts either by warships or shore batteries on which powerful and long range ordnance are mounted. Discussing the endurance or "life" of guns, having in view those mounted on war vessels and with special reference to the forcing of the Dardanelles, a writer in the Liverpool Journal of Commerce says that it is well known that gun rifling becomes worn down after a certain number of rounds have been fired, and, although the gun can still be used, it is no longer efficient in rotating its projectile.

The maximum number of rounds depends on the size of the gun and on the value of the charge used, the life of the gun being generally expressed by the number of full charges that can be efficiently used. If great penetration is necessary, as for armour piercing, full charges would generally be taken, but with high explosive shells the essential thing is to get the projectile on the ob-

jective, its explosion does the damage. The full powder charges are usually made up in four equal parts, and three-quarter, half, or quarter charges, will be used in accordance with the distance to be covered.

The 15-in. guns on our battleship Queen Elizabeth are capable of firing shells a distance of over twenty miles. The official reports of the Dardanelles firing indicate, however, that nothing like this distance has been found necessary, and it may be taken for granted that full or service charges have rarely, if ever, been used by that vessel, thereby increasing the number of rounds that can be fired. In firing across the Gallipoli peninsula at the inner forts, the maximum ranges did not exceed twelve miles.

### Gun Calibre a Factor.

The number of full charges that can be fired increases very rapidly with the calibre of the gun. The nominal figure for the British 12-in. gun is given as eighty, but twice this number can be used with effect. In the 13.5-in. 45-calibre gun, 450 rounds are possible. The figure for the latest 15-in. guns have not been published, but the number can safely be taken as being considerably in excess of that for the 13.-in. gun.

The reason for this great increase in endurance is not far to seek. High muzzle velocity is most effective in wearing down the rifling, and in the larger guns this has actually been reduced. The muzzle energy has, however, been increased by adding considerably to the weight of the projectile. The heavier shell also possesses a great advantage in carrying an explosive charge very much larger than that for the smaller gun.

### Re-tubing.

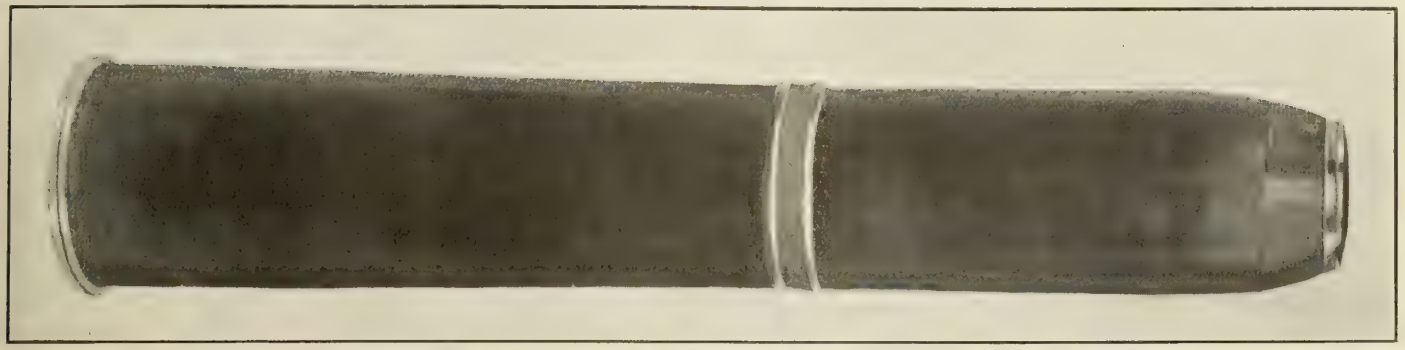
When the rifling is worn out, the gun must be re-tubed, an operation which can only be performed at a dockyard or naval base. It will be readily seen that the staying power of the Queen Elizabeth in this direction must be of immense value in the present operations, and it is not improbable that other vessels with modern guns will be brought into action against the forts at the Dardanelles.

The First Lord of the Admiralty, speaking in March of last year with reference to the 15-in. guns, said "the whole of the 15-in. guns for the ships of the Queen Elizabeth class were ordered without ever making a trial gun. They reproduce all the virtues of the 13.5-in. gun on a larger scale, and as it is never pressed to its full compass by explosive discharge, it will be an exceptionally long-lived gun." These predictions have been abundantly fulfilled, and give a further justification of the big-gun ship.

### Big Gun Preponderance.

The large number of big naval guns available at the Dardanelles is surprising in view of the presence of numerous warships in other places, and is a striking tribute to the naval power of the Allies. Taking the vessels that have been mentioned officially, it appears that the following big guns have been or can be put in operation against the forts:

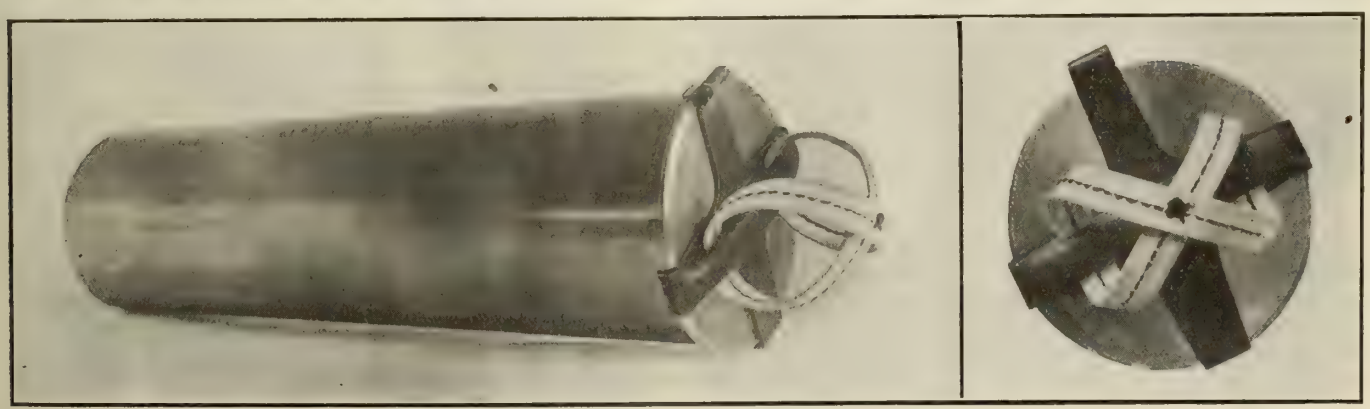
Eight 15-in., sixty-two 12-in., four 10.8-in., eight 10-in., twenty-four 9.2-in., and twenty-eight 7.5 in., making a formidable total of 134. How many of these guns have been pressed to their full capacity it is impossible to say, but the need for renewal facilities is apparent. Malta Dockyard is a tremendous asset to the Allies in this direction alone, apart from the numerous other functions it fulfils. In any case the renewal of the naval guns is a much easier matter than that of the weapons on the land forts, a fact which will hasten on the inevitable result.



CANADIAN MADE 18-POUNDER SHRAPNEL SHELL AND CARTRIDGE CASE.

## LESSONS FROM THE SHELL PROBLEM.

A STUDY of shell manufacture as it is being carried on in Canada at the present time reveals at least three different general systems being employed. These may be stated as follows:—First, the full automatic method; second, the standard machine tool plan, with grinder finish; and third, the standard machine tool method with machine finish. The first system is applicable only to institutions that are willing to make a considerable investment in special machinery. This consists of grinders, automatic milling machines, furnaces, etc.



CARTRIDGE CASE WITH DRA[illegible]NG CLIP ATTACHED.
This clip is one of the incidentals being made in Canada for the British Government and forms an interesting job of blanking, piercing and drawing.

Uncertainty as to the duration of the war and the ultimate quantity of shells required are factors that must necessarily be considered when determining any particular system. The prices obtained for the work being fixed, and the market for the duration of the war practically unlimited, there is offered very great advantages by the automatic system of manufacture if the investor obtain orders enough to ensure at least the return of the capital invested. In several cases the adoption of the full automatic method has been made feasible by the fact that the special machinery purchased for shell manufacture can be readily assimilated into the general system of the plant at the close of the war.

The factories of Ontario and the Eastern Provinces generally have in the past been slow to adopt the latest types of machinery for their regular work so that the preparation for the shell business is likely to eventually result in putting machinery manufacture in Canada upon a more up-to-date and better paying basis. The system of producing shells adopted by the greater number of Canadian factories is that involving the use of standard machine tools along with the addition of special grinders, etc.

### An Interchangeable System.

Much credit is due the various managements for the manner in which they have met the need for special machines and appliances demanded, and so complete has been the organization of the business by the Shell Committee that arrangements can be made for any plant to do whatever part of the whole work comes within its capacity. A number of plants are turning out shells with a tool finish, but many are adopting the grinding method as this is being more fully developed to meet the special need. Without doubt, the most useful adjunct to any plant undertaking this shell production work is a good mechanical schemer to devise ways and means. Shell making belongs properly to the interchangeable manufacturing system and a plant designed for doing this work and nothing else would have a tremendous advantage over the converted plant, but this advantage can be greatly lessened for the jobbing shop by a resourceful mechanical head. The small plant, in making investments in new machinery is advised by the better authorities to buy heavy standard machines such as will be of most use when the war is over and the needs of peaceful trade begin again to demand attention. The greatest mistake that has been made so far even by firms whose capital investments have been considerable, consists in the purchase of too light machine tools, particularly in the matter of grinders and milling machines.

### General Impressions.

For the first operation of cutting off the open end of the rough forging, everything from bolt cutters to Gisholt lathes are being used. A most practical and successful arrangement seems to be that using two cut-off tools feeding towards each other and operated by a right and left hand screw. This may form part of the regular cutting-off machine, but has been successfully applied to lathes and pipe machines. By applying a power feed mechanism, one man can easily handle several machines.

For the facing of the bases also, a number of creditable devices are employed. There seems to be no doubt, however, as to the ascendency of the milling machine which is powerful enough to work large high speed facing cutters to their capacity, and in which the process is practically continuous. Machines of this kind have handled as high as 1,200 shells per day of 20 hours.

### Heat Treatment.

The rough turning of the body has perhaps been subject to the greatest variety of ways and means, and the result of an extended observation seems to favor the heavy turret lathe for this work. The forging is best held on and driven by a solid arbor securely fastened to the face plate of the machine. Otherwise, if a centre is used, it interferes with the facing of the end, and, if a driving dog is used, the shell cannot be turned for nosing at the same setting. The use of multiple tools as adopted in the low-swing lathe has been more or less discouraged by the lack of uniformity of the shell case material, many having tried this, and have gone back to the single tool that can be quickly replaced when dull or injured.

An interesting method of grinding has been developed in this connection. Tool bits are made in sets of 16, and all are ground exactly the same, particularly as to length. The mechanic can thus dull 16 tools without changing the adjustment of his machine, and when the set is dull, all the tools are finish ground at a single setting of the grinding machine. Multiple tooling in which the tools operate on opposite sides of the work, thus neutralizing the lifting strain on the arbor has been found quite satisfactory in several plants and has resulted in an increase of production. For the boring also the heavy turret lathe is undoubtedly popular, although the multiple spindle machine has not come up to expectations.

Of the many types of cutter employed, the flat, formed, high speed steel bit that can be quickly removed and replaced has been well proven. High speed steel twisted drills which have been ground to a suitable form are conceded to do good work but are complained of as being bulky and expensive. Multiple spindles are of advantage where the tools can be operated independently.

For heat treatment, the different makers have been left largely to their own resources with the result that many widely different plans have been adopted. The most striking feature in connection with this is the elaborate nature of some equipments while others are accomplishing satisfactory results with a much simpler and less expensive outfit. This applies particularly to the annealing.

Where sand blasting is available, all that is necessary is to prevent undue oxidation, otherwise the base and groove must be treated before heating with something that will not only prevent oxidation, but which will facilitate cleaning as well. Boracic acid has been successfully employed for this purpose, the shells being washed in water as soon as possible after chilling. Nosing seems to present few difficulties, everything from bulldozers to converted stamping presses being employed with success. The vertical, quick acting machine, however, has decided advantages.

For turning the nose inside and out, the ordinary diamond point tool guided by a profile cam appears to be the most successful. Formed tools are used to a considerable extent, but there seems to be no advantage in point of output over the regular turning tool and cam. Another advantage with the cam method is that very light machines can be used, whereas a formed cutter of these dimensions would demand a powerful lathe. The tapping is apparently most satisfactorily done on a machine by itself, using a collapsible floating tap.

### Assembling.

The assembling involves a large number of small operations and a great deal is to be gained by a systematic arrangement. Many firms have gone to some pains to heat the bullets, while others claim this precaution to be unnecessary: an examination of the rosin at its most liquid temperature would seem to bear this out. If this heat be maintained and the rosin run in quickly no trouble should be experienced with poor fluxing. Screwing in of the sockets is done by hand with plug drivers and wrenches. Some plants are using ball bearing plugs, while others declare these to be a failure and are using solid plugs instead. One or two firms are building machines for this, as well as to fill the shells with the exact number of bullets.

Finishing the socket is best done with a flat formed cutter which can be ground without altering its form, but this should be set up along with another tool for finishing the inside so that neither will have to be changed throughout the operation. Circular forming tools have not proved an unqualified success either in this or turning the band.

# Shrapnel Shell Manufacture

## Shell Department of a Stationary Steam Engine Works

Staff Article

*In this particular plant, shell forging from the bar and billet is an additional feature to the machining and otherwise completion processes required of Canadian manufacturers of shrapnel shells, and, as would naturally be expected of a firm whose particular specialty has been and is still high-class steam engine work, there is evident the same studious regard to the exactions of shell production as has characterized their achievement in the other sphere.*

THE methods of accomplishing the various operations necessary in finishing an 18-pounder shell call for a rather extensive list of gauges, tools, jigs and fixtures, even when the work is done on machines designed particularly for the purpose. However, when a shop does not purchase new equipment extensively, but adapts its standard machines by the addition of special tools and jigs, the result is that some remarkably ingenious devices are developed.

The plant here described and illustrated has adopted this policy for two reasons. Firstly, because the character of the work was entirely new and it was deemed wiser to accept only a small order to begin with as an experiment. The second reason was the inability of machine tool manufacturers to give early delivery of shell-making tools.

Every available engine lathe was therefore pressed into service. As new machines were delivered and the demand for shells showed no abatement, the standard lathes were still utilized. From time to time improvements in the various attachments were made and operators in the meantime had become very expert. It was thought then to be hardly profitable to throw out all the old machines and replace them with new ones of only slightly better efficiency, especially as the shell demand will automatically cease at the end of the war.

### Forging 18-Pr. Shell Blanks.

This shop has been so successful in its machine shop work that the forging of the shells was undertaken in their boiler shop, on a regular type hydraulic press used ordinarily in boiler work. Special dies were made in the tool-room of the shop. In this department, too, excellent results were obtained. Later, three R. D. Wood hydraulic presses were installed expressly for the work.

The steel used to make the shells is from 3½ in x 9 ft. round bar high carbon machinery steel, and the bars are sawn into billets, each about 4½ in. long. Four 24-in. Newton inserted tooth cold saws operate constantly on their production. The saws are driven by individual motors, as will be seen by referring to Fig. B, while the clamps are operated by compressed air. A neat arrangement for handling the bars is part of the equipment of each saw. The bars are carried to the saws by an overhead electric travelling crane and are placed on racks which are built with a slight incline. A bar is allowed to roll off the rack by gravity into the saw carriage.

Provision is made to insure that the bar is moved ahead the proper distance each time a new cut is taken. The bar itself is moved by means of a hand-wheel which traverses the carriage, through the medium of a rack and pinion. A steel rod is attached to a casting fix-

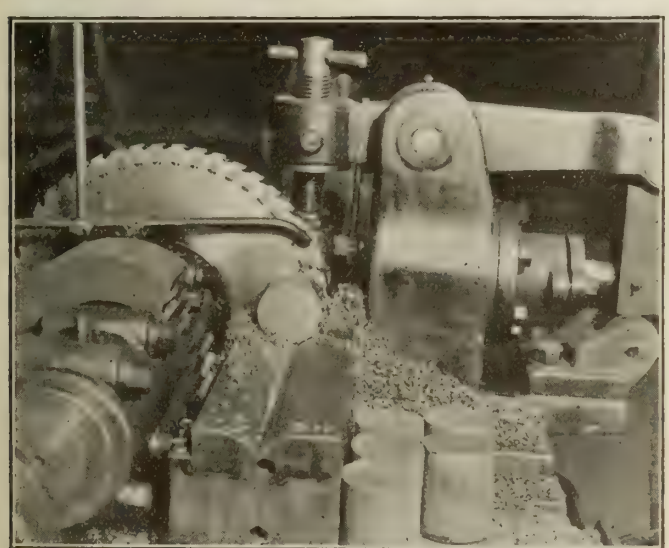


FIG. A—NEWTON SAW CUTTING SHELL BILLETS FROM THE STEEL BAR.

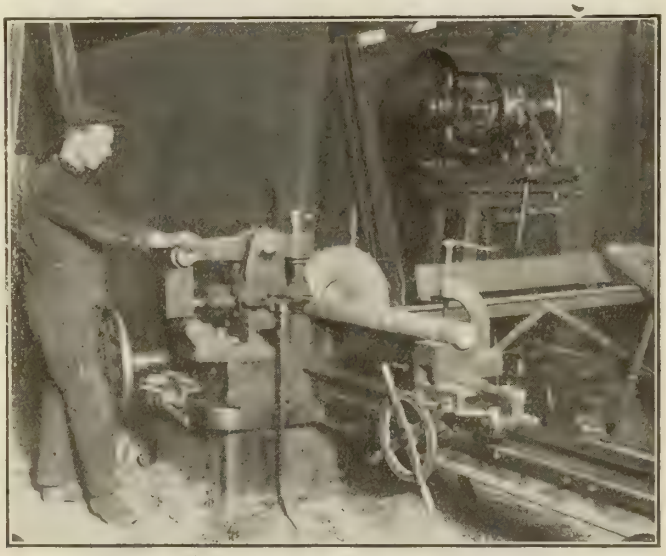

FIG. B—NEWTON SAW SHOWING MOTOR AND STEEL BAR FEED MECHANISM.

ture which can be moved along the bed of the machine and clamped at any position. A part of the saw carriage upon which the bar being cut up into billets

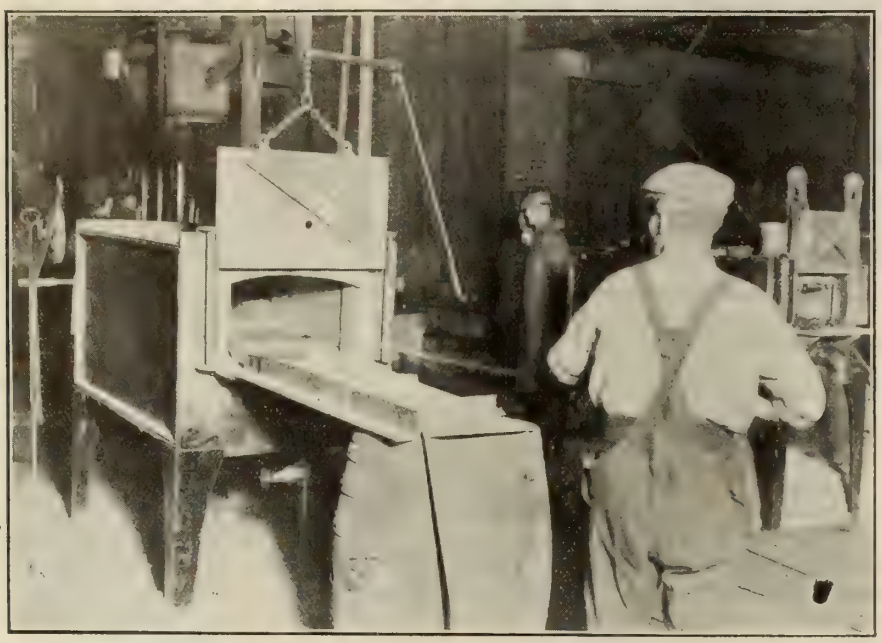

FIG. E- BELLEVUE ANNEALING FURNACES FOR HEAT TREATING STEEL SHELL FORGINGS IMMEDIATELY THEY LEAVE THE WOOD PRESSES.

is mounted, fits over the steel rod, and the fixture which carries the rod is moved up close to the lug from the carriage and clamped solidly. Thus, at the completion of a cut, the saw is withdrawn and the air clamps released. The bar is then moved up for the next cut.

The projecting lug from the saw carriage follows the steel rod until it comes up against a stop collar on the latter, and when the rod is moved this distance it is in position for a new cut to be made. The clamps are then applied and the saw started in to work again. Meanwhile, the stop casting is unclamped from its position and is moved up till the lug is again against the stop casting where it is again clamped, ready to measure off the next length. It takes one of these saws one minute and thirty-five seconds to cut through the 3½-in. round. Water lubricant is used on the saw.

The saws have inserted teeth and are giving excellent satisfaction. The time a set of teeth will run without re-grinding varies, but a casual inquiry, however, resulted in the following information being given: A saw was put in commission at noon one day and three days later at 4 p.m. it was still doing good work. Two men keep the four machines running, and the maximum production of one machine per hour throughout the twenty-four hours will be a little over thirty billets.

### Heating Billets and Forging.

The furnace used to heat the billets when operations were first started was an ordinary Rockwell plate-heating oil furnace. However, as the plant began to run smoothly, the capacity of this furnace was not sufficiently great to feed the presses, its capacity limiting the output of the forging plant to 1,600 forgings per day. The firm then designed

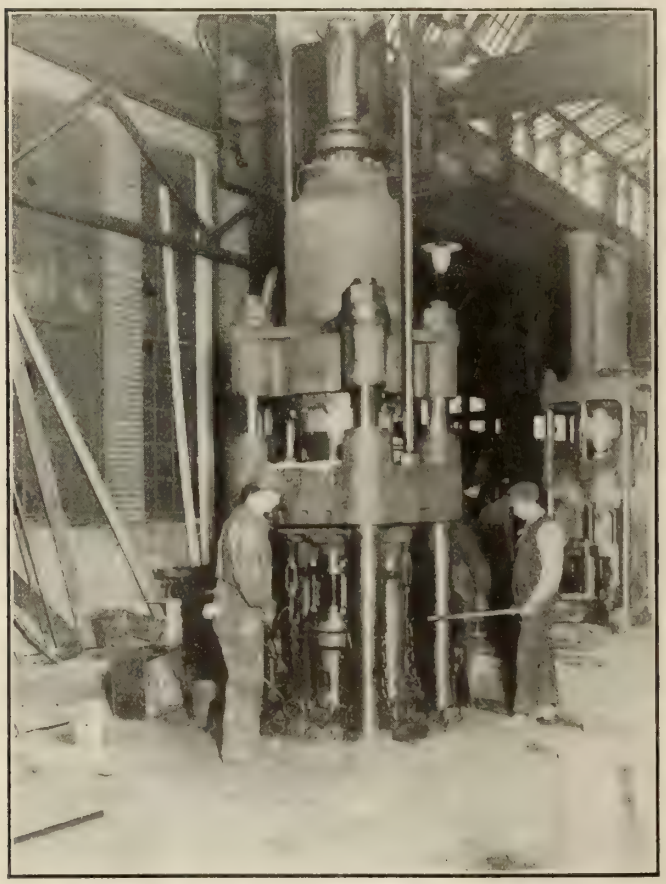

FIG. C- 350-TON R. D. WOOD HYDRAULIC PRESS PERFORMING FIRST OPERATION ON 18-POUNDER SHELL FORGINGS.

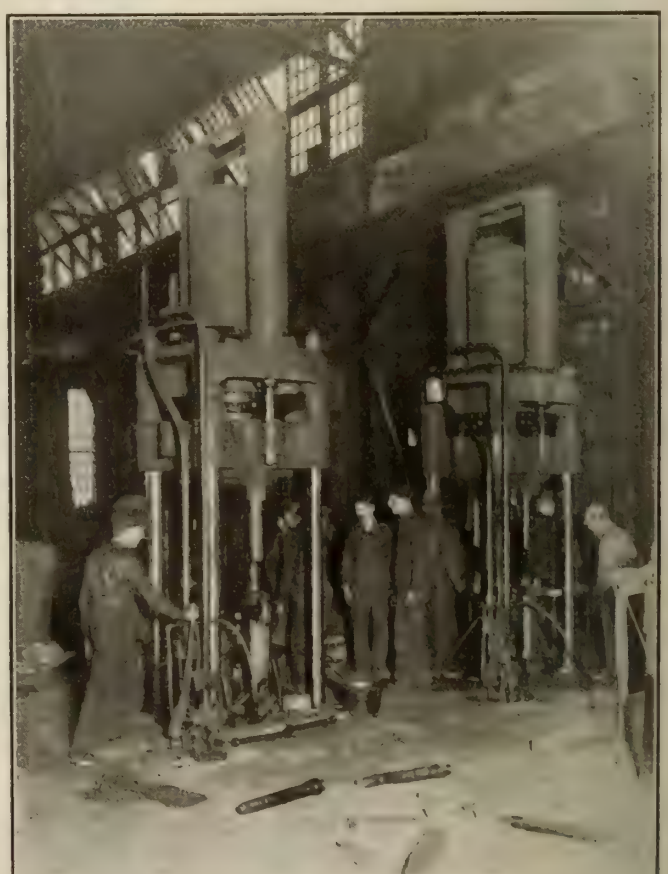

FIG. D—250-TON R. D. WOOD HYDRAULIC PRESSES PERFORMING SECOND AND FINAL OPERATION ON 18-POUNDER SHELL FORGINGS.

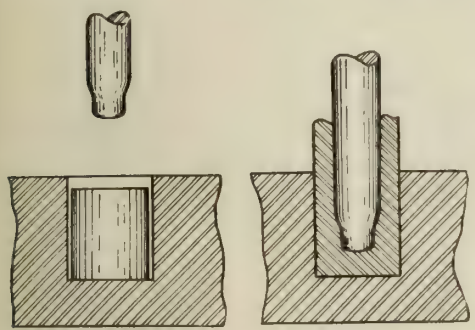
and built a special oil furnace, the muffle of which was constructed on a slight incline. The billets were fed into one end of the furnace and were taken out of the other, the movement of the billets being caused wholly by gravity. The production of the plant is now about 3,000 shells per twenty-four hours.

The billets are heated up to about 2,100 deg. F. and the shell forging is completed in two operations with one heating. The billets are taken from the furnace two at a time by two men. They grasp the billets with tongs and swing them into the dies, knocking the loose scale off in transit by striking the hot billets against a steel block. The punches are well greased with graphite mixed with heavy black oil.

The first or "piercing" operation is performed on a 350-ton, two-punch,



SHELL FORGING—FIRST OPERATION OF PIERCING THE BILLET.

hydraulic press. The billet is pierced and the length of the shell is increased from 4½ inches to roughly 8 inches, as shown in Fig. F. The forgings are taken from the big press immediately to the smaller 250-ton two-punch presses. Here they are placed in a forming die and the punches are allowed to descend. This operation forms the bottom or back end of the shell and makes it the proper size for the drawing die operation, which follows immediately.

The punches are lifted and the forgings are taken up with the punches. The small base-forming dies are removed, the punches again descend, and the forging passes through a series of drawing dies which draw it out to length. It has been found that all these operations can be accomplished with one heating now that the men have become accustomed to the work, and with dies and punches of proper design.

The large press can handle about 150 billets per hour, being its maximum capacity under favorable conditions. The punches in the smaller presses have two operations to accomplish and this not only takes up more time, but heats the punches and dies considerably. Thus, the maximum capacity of these machines is only about half of that of the larger press, or 75 an hour.

The billets after passing through the drawing-out dies are taken from the under side of these and placed in the Bellevue annealing furnaces shown in

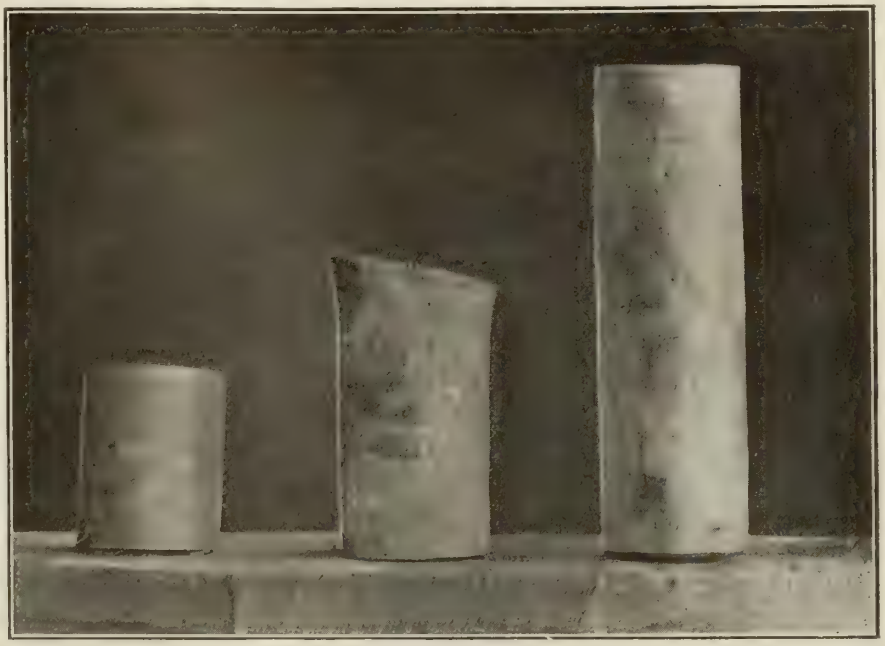


FIG. F SHOWING STEEL BILLET, SHELL AFTER FIRST OR "PIERCING" OPERATION, AND FINISHED FORGING.

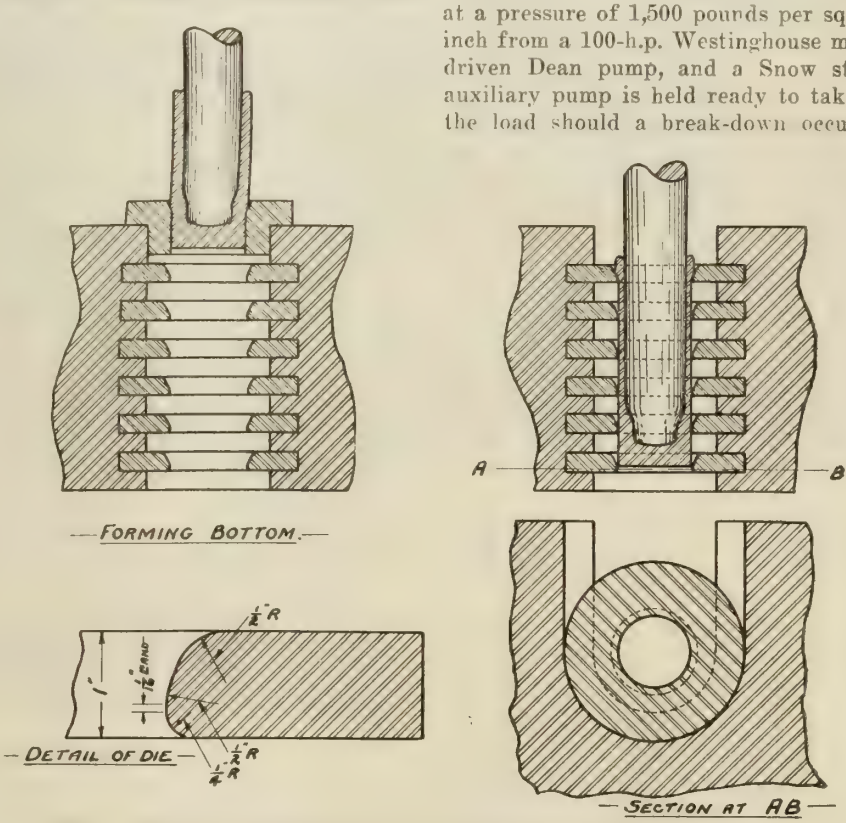
Fig. E. This process is to remove the effects of the chill caused by the comparatively cold dies and punches, and prepare the forging for machining. One reheating Bellevue furnace is placed between the large press and the small presses, and any semi-finished forging which is delayed in the first operation or for any reason appears too cool to go to the second presses, passes through same. A certain number of billets going through the presses at the same time are all placed in one rack and a heat number assigned to them.

The presses are supplied with water at a pressure of 1,500 pounds per square inch from a 100-h.p. Westinghouse motor driven Dean pump, and a Snow steam auxiliary pump is held ready to take up the load should a break-down occur in the motor-driven unit. The production at present approaches three thousand shells per day of twenty-four hours.



SHELL FORGING—DRAWING-OUT OPERATION IN SECOND PRESS.

**Machining 18-Pr. Shrapnel Shells—Cutting Off the Ends.**

The rough shell forging is from one to two inches too long, and the first operation in the machining of the shell is to cut off the ragged end of the forging. This is done on various types of "cutting-off" machines. A representative type is shown in Fig. 4, Plate I. This is a Hurlbut-Rogers machine, fitted with a three-jaw universal chuck. The shell is pushed into the chuck against the pressure of a coil spring, and a plunger is used to place the shell in the jaws the proper distance. This plunger is bolted to the bed of the machine and is shown in Fig. 21. The link B is fastened with a set-screw on the rod C and the end of the rod is placed in the shell, coming in contact with the bottom.

The shell is pushed in the chuck with the rod C until the projecting arm of the link B can be slipped into the slot A. Then the jaws of the chuck are tightened. The pressure of the coil spring in the chuck tends to keep the shell pressed firmly against the plunger C. Two tools are used in this machine and these are fed into the work by power.

Other types of machines used for this work are as follows: An ordinary Canada Machinery Corporation engine lathe is being used to face off the back or solid end of the shell. The chuck used is shown in Fig. 22. This chuck is supported by a steady rest. The shell is pushed into the chuck against a stop and held there by the tailstock spindle while two set-screws are tightened down. A high-speed steel tool is used to face some ¾ of an inch to ½ an inch of metal off the solid end. The surface (f) having been finished, a little steel distance gauge placed against the finished edge shows the operator when sufficient material has been removed in this rough facing operation.

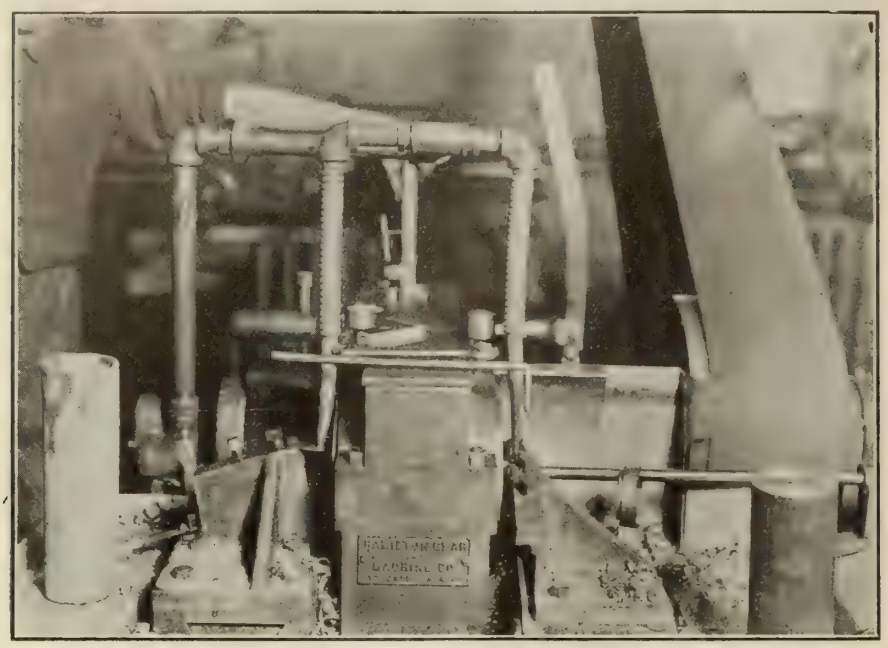


FIG. G -ROUGH FINISHING TO LENGTH, BOTH ENDS OF SHELL FORGINGS ON A HAMILTON GEAR & MACHINE CO. CUTTING-OFF MACHINE.

The machine shown in Fig. G, manufactured by the Hamilton Gear & Machine Co., is one especially designed to cut off both ends of an 18-pr. shell simultaneously. The shell is placed in a chuck with a plunger bar which locates it. The jaws are tightened and the machine started by means of a clutch. The tools are then automatically fed into the work and the shell is cut to rough length and the end faced in one operation. This machine will handle about 20 shells an hour.

All of these machines are connected with the general system of piping through which cutting lubricants are allowed to play freely on the tools. A mixture of lard oil washing soda and water is used on the tools in the operations just described. A second Hurlbut-Rogers friction drive cutting-off machine is also fitted up with a chuck and tools for this work. From these machines the shell goes to the testing bench where it is tested for length and thickness of bottom. The gauge used is shown in Fig. 23.

**Rough Turning on Turret Lathes.**

Five Jones & Lamson turret lathes are fitted up to accomplish this work. All are hollow spindle machines and each is fitted with a McDougal expanding chuck, the details of which are shown in Fig. 24. A handwheel is fitted to the rod which extends through the hollow lathe spindle. Two sets of three jaws expand and tighten against the inner surface of the shell which is pushed on the chuck until the end of the latter, which acts as a stop, is in

Some of the above gauges are required in different sizes.

contact with the bottom of the shell. The jaws are caused to expand by the two tapered lengths of the central spindle of the chuck. It will be noted that there is a slight factor of adjustment between these two tapered portions in the shape of a stiff spiral spring. Thus, as the small pair of jaws are designed to seize just before the larger, this spring allows the tapered portion of the spindle to continue to tighten the larger jaws, the spindle between the two sets of jaws meanwhile telescoping slightly to allow this to occur. Flat steel springs withdraw the jaws from the work when the hand wheel is turned so as to release the jaws from the shell.

roughing tool approaches the end of its cut a second tool starts in. This second tool finish turns the shell up about two inches. It is shown in Fig 3, Plate 1. Heavy oil is used as a cutting lubricant on all five of these machines during the operations. When this operation is completed, the turret is swung around and a tool is started to work which refaces the blank end of the shell. This tool works from the near side of the lathe. As soon as the end has been refaced, another tool is fed into the work from the far side of the machine. This tool rounds off the corner of the shell to a curve which has a radius of 1-10 of an inch. This completes the series of

end and the recess has been finish-turned in the turret lathe operation just described. There are various methods of machining this groove and likewise many attachments fitted to various types of lathes. In this shop, a rather simple tooling arrangement has been designed and fitted to an ordinary McGregor-Gourlay engine lathe. Figs. 1 and 5, Plate 1, show two views of the lathe so fitted. The waving attachment is shown in the foreground of each cut. On the far side a turret tool post is placed. This lathe is fitted with a special cast-iron hinged chuck, the latter being bolted to the face plate with four cap screws as will be seen in Fig. 5.

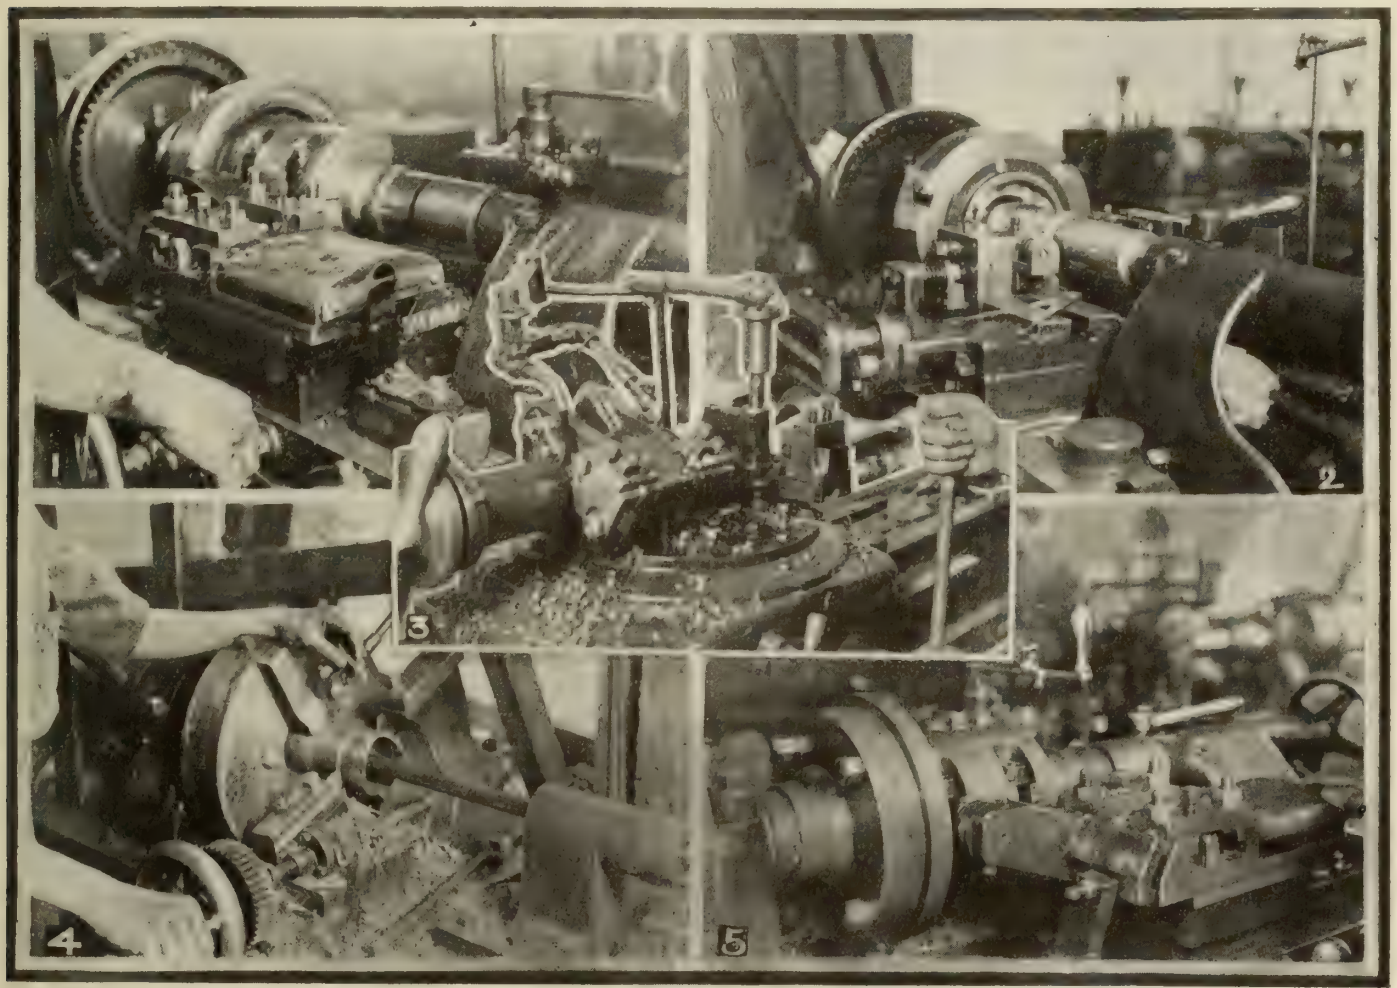

PLATE I.—(1)—A "MADE-IN-CANADA" WAVING ATTACHMENT HAVING A CAST IRON CAM ON THE FACE PLATE. NOTE FLAT SPRING TO KEEP ROLLER TOUCHING CAM. (2)—BERTRAM WAVING ATTACHMENTS MOUNTED ON A McGREGOR-GOURLAY (CANADA MACHINERY CORPORATION) STANDARD ENGINE LATHE. (3)—ROUGH TURNING ON A JONES & LAMSON LATHE. (4)—CUTTING-OFF OPEN END OF SHELL FORGINGS ON A HURLBUT-ROGERS PARTING MACHINE. (5)—A "MADE-IN-CANADA" WAVING ATTACHMENT.

Before the shell is put on the expanding mandrel, there is placed on it near the open end, a small driving dog shown in Fig. 25, and the tail of this dog is fitted into a slot in the face plate of the machine. In this way the greater part of the strain of driving the shell is removed from the internal chuck.

The first metal removed from the shell in this operation is by a multiple-tool turning attachment fitted to the turret. The first tool rough turns the shell up to about two inches of the open end. As the

operations on all five similar turret lathes fitted up for the work. The shell is next given a bath in hot soda water to remove all the oil and chips.

### Cutting the Recess and Forming the Wave Lines.

The next operation is to cut the recess for the copper rifling bands and to form the wave lines in the bottom of this recess. The recess is placed less than one inch from the back end of the shell and that part of the shell between the back

On the face of the flange which bolts to the lathe face plate, a triple cam is cast, this being used to form the wave lines in the bottom of the groove. The cam was not finished on a machine, the casting being merely smoothed up and the scale left untouched so that it would present a better wearing surface to the roller.

The shell is clamped in the hinged chuck against a stop, and the tail-stock is pulled up to it. A revolving centre on the tailstock spindle serves to hold the shell more firmly in the machine. The tail-

stocks of the lathes in use on this and many other operations are all fitted with a lever by which they can be quickly and easily moved on the ways. The carriage is locked to the ways of the lathe during the operation.

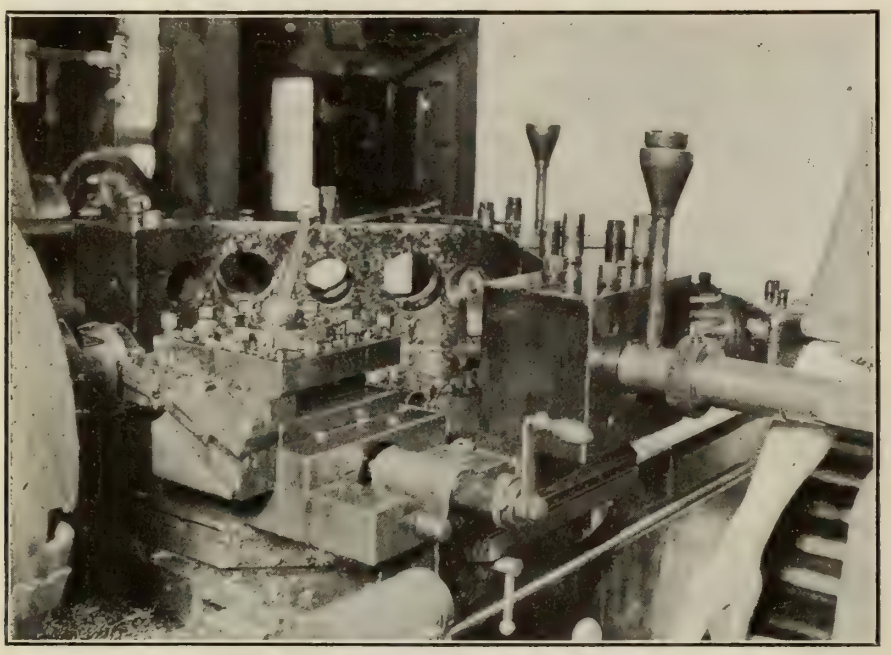

FIG. 7—AMERICAN TURRET LATHE FITTED UP FOR BORING 18-POUNDER SHRAPNEL SHELLS.

The first tool in this operation cuts the groove roughly to its width, the central portion of the groove being only cut down to a diameter slightly larger than the diameter over the top of the wave lines. On each side of this diameter, the groove is turned to finished depth. The tool is held in the turret tool post and approaches the work from the back, and a snap gauge is used to ascertain when these grooves are finished to the proper depth.

When this operation is finished, the turret tool post is swung around and two little right and left hand tools for undercutting the edges of the recess are fed into the bottom of two little full-depth grooves. A small hand lever actuates a cam which feeds these two tools into the work in a direction parallel to the long axis of the lathe. These two tools widen out the recess to a finished size and at the same time undercut the edges. The hand lever by means of which these tools are fed into the work comes up against a stop when the finished width of the groove is obtained. The tools are withdrawn, and then the waving tool is next put into action, the cross slide being moved toward the centre of the lathe. The carriage remains locked to the ways throughout the operation. Just before the roller comes in contact with the bevel on the edge of the wave cam, the direction of rotation of the lathe is reversed, and the roller moves over on the cam with comparative ease. A plain, flat spring, shown in Fig. 1, Plate I, keeps the roller in close contact with the cam.

FIG. 9—HEAT-TREATING SHELLS WITH CANADIAN HOSKINS FURNACES AND OIL TANKS.

The tool is fed into the work and it cleans up the bottom of the recess groove to size and forms the little wave lines in the bottom of the groove. A heavy oil cutting lubricant is used.

When the tool is withdrawn, the spring pushes the tool slide up against the stop shown in Fig. 5, which stop simply consists of set screw and locknut in a bracket bolted to the lathe carriage. This tool is being worked constantly and is giving the greatest satisfaction both with regard to quality and quantity product. Only one tool of this description is in use in the plant at the present time.

To perform this grooving and waving operation, the John Bertram & Sons Co., Dundas, have designed a fixture and two of these attachments have been fitted to a standard Canada Machinery Corporation engine lathe and a McGregor-Gourlay engine lathe respectively. Fig. 2, Plate I, shows the tool attached to a McGregor-Gourlay engine lathe. Bolted to the face of the chuck is a triple face cam, and the fixture which carries the tools is clamped rigidly to the ways of the lathe. On the near side of the machine, the waving tool is placed, being mounted on a sliding tool-holder, on one end of which is placed the bracket which carries the cam roller. A stiff spiral spring presses on the opposite end of the sliding rest which always keeps the roller pressing firmly against the cam on the chuck face.

The waving tool is of much the same design as the tools employed in other fixtures designed to do this work. The tool-holder is itself fitted in a little slide, along which it is moved when fed into the work. A stiff spring keeps this tool-holder pulled out of, and back from, the work. On the far side of the fixture, clamped to the ways of the lathe, are located the two undercutting tools. These are also fastened into little slides, but are fed into the work at an angle to it, thus forming the undercut. The tools are so ground that the bottoms of the two grooves thus cut, are parallel to the longitudinal axis of the shell. Both of these tools are held out from the work by means of coil springs.

A third part of the tool, which is clamped to the lathe carriage, consists of a fixture in two parts, carrying three cams. In operation, the carriage is moved toward the headstock of the lathe by means of the feed screw, and one of the cams, as it travels, forces the waving tool on the near side of the lathe into the work and at the same time the face cam causes the tool to oscillate. The shape of the tool cutting edge forms the wave lines in the bottom of this groove. Simultaneously the two cams on the back of the lathe

carriage feed the two under-cutting tools into the work. The cams are so designed that they feed these tools into the work to the proper depth, and the feed screw regulates the speed with which the carriage travels and therefore the speed with which the tools are fed into the work.

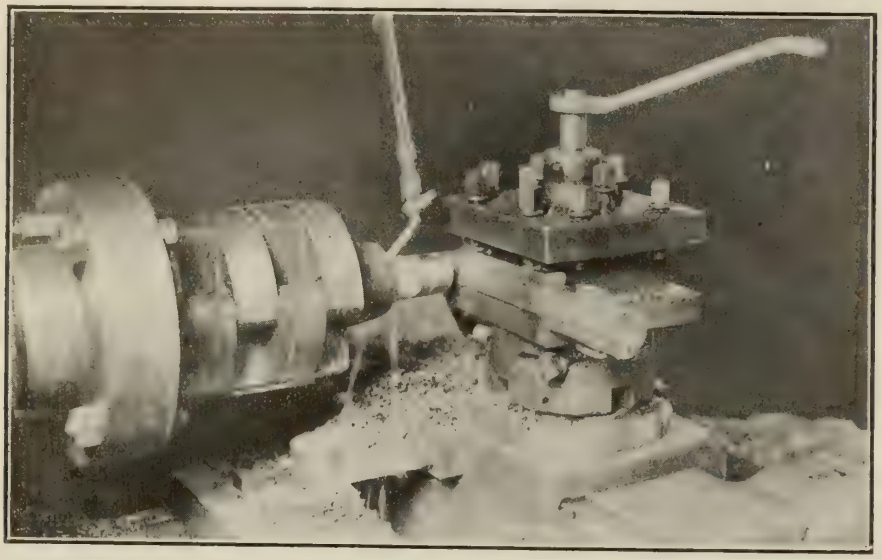

FIG. 11—IMPROVISED TURRET ATTACHMENT ON A STANDARD ENGINE LATHE.

The under-cutting tools are so designed that they clean up the edges and bottom of the groove to the proper depth and width, and the whole operation is most rapidly accomplished. Fig. 26 shows a sketch of this tool which is accomplishing such a difficult operation in so short a time. The shell is placed in the chuck against a stop which ensures the proper location of the recess, and the cutting tools are held clear of the work because of the springs. The other end of the shell is supported by a revolving centre held in the tail-stock spindle. After this operation, the shell is carried to the hot soda water tanks to be washed.

### Boring Powder Pockets and Diaphragm Seats.

The boring operations are carried out entirely on turret lathes, there being three different types of these machines somewhat similarly tooled upon which the boring and the rough taper turning of the nose is done. The first type of turret lathe is an old type American heavy-duty machine, a cut of which is shown in Fig. 7. A hinged chuck is fastened to the face-plate of the turret lathe by means of cap screws. The first tool to enter the work has a wide cutting edge ground at an angle, and this tool removes the shoulder formed by the rough turning operation, and turns the end of the shell at a taper. The tool is not travelled along the work, but merely fed into it, and its wide cutting edge ground on a bevel forms the taper. This tool is shown in operation in Fig. 7. Heavy lubricating oil is used as a cutting lubricant.

The next operation is the rough boring of the powder pocket. The tool for this purpose is quite clearly seen in Fig. 7. It is gashed for chip clearance, and a collar on the boring bar acts as a stop when the tool has reached the bottom of its cut. The rigid construction of the boring bar is seen in Fig. 7, as also is the solid construction of the turret. The oil is carried to the machine through the pipe shown in the upper left-hand corner of the cut, and is allowed to flow into the funnel in the tool bar and thence through a duct in the tool bar to the tool. The turret is then swung around and the next tool is also a gashed cutter to rough bore the diaphragm seat. A tool on the shank end of the boring bar rough turns the nose of the shell for almost one-half to three-quarters of an inch straight, and then comes up against a stop arranged in the tool bar to come against the end of the shell. The next swing of the turret brings a boring bar carrying the two finish boring tools into operation. Oil is fed into the funnel-shaped duct and led through the bar to the cutters.

Both the finish cutters for the powder pocket and the finish cutter for the diaphragm seat are carried in this boring bar, the former vertical and the latter horizontal. These cutters are not gashed, and a stop-collar on the boring bar indicates when the bar has been fed in the proper distance. By putting in both finish cutters together, the distance that the diaphragm seat is above the bottom of the powder pocket is fixed. Also, the two cutters, one placed vertical and the other horizontal, have a tendency to make the boring bar much more rigid.

The next machine to this is a flat turret lathe of the latest Jones & Lamson design. This machine was built and tooled especially for its work by the manufacturers. The shell is chucked in the standard chuck of the machine and placed up against a stop and the boring bars are most rigidly clamped to the turret, from which three boring bars radiate. One bar extends right across the turret, is clamped in the two supports, and has tools in both end extensions. Another bar passes right through the clamp on the turret, and its extension is mortised into the first bar. In this way an extremely rigid arrangement is obtained.

The first tool to enter the work is the roughing cutter for the powder pocket. The end of the nose is also faced and the outside of the nose is rough-turned taper with a tool having a wide cutting surface ground on an angle to the work.

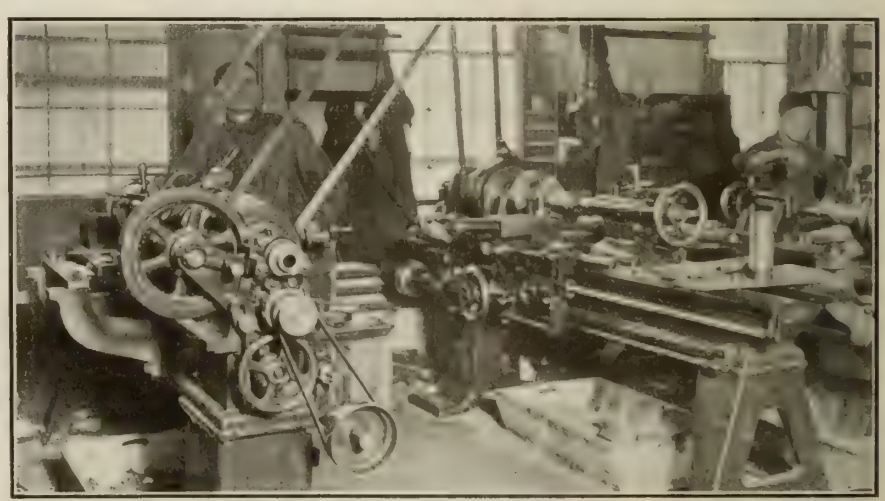

FIG. 14—FINISH TURNING SHELLS ON ENGINE LATHES. ONE MAN RUNNING TWO MACHINES.

Oil is used as a cutting lubricant. The rough cutters here are also gashed for chip clearance. The turret is next swung, and the roughing tool for the diaphragm seat is then fed into the work. These two rough boring tools are placed ver-

tically in their respective boring bars. The finish cutters are both placed in one boring bar, the powder pocket cutter in this case being vertical and the diaphragm seat cutter horizontal. The roughing cutters are both placed in the opposite end extensions of the same bar, while the finish cutters are placed in the bar that is mortised into the larger bar.

The next turret lathe fitted up for boring the shells is a Jones & Lamson machine similar in design to the last one described, only that it is a double spindle machine. The tooling arrangement is somewhat different, however, from that of the single spindle machine, and can be seen in Fig. 27. The nose of the two shells are first turned taper, and the last half inch is turned straight; the ends of the noses are also faced to length. The turret is then swung and two 15-16 inch drills with their noses ground flat, are fed into the bottom of the powder pocket. These drills are plainly seen in Fig. 10, Plate II, as also are the other tools on the turret.

The next swing of the turret brings the boring bars carrying both gashed roughing cutters into position. Both these tools, one roughing the powder pocket, and the other roughing the diaphragm seat, are fastened vertically into one bar. Another swing of the turret brings the boring bars carrying the finish cutters into position. The finish cutters are fixed in the boring bars in a manner similar to that in which the finish cutters in the bars of the two lathes just described were fixed, namely, the powder pocket tool vertical, and the diaphragm seat tool horizontal. Stops on the machine indicate when the tools have been fed into the required depth. The same rigid principle of having one set of boring bars extend directly across the turret and of having the other bars mortised into these, has been here also applied. The machine is doing accurate work, but the firm is not yet satisfied with the number of shells turned out per day.

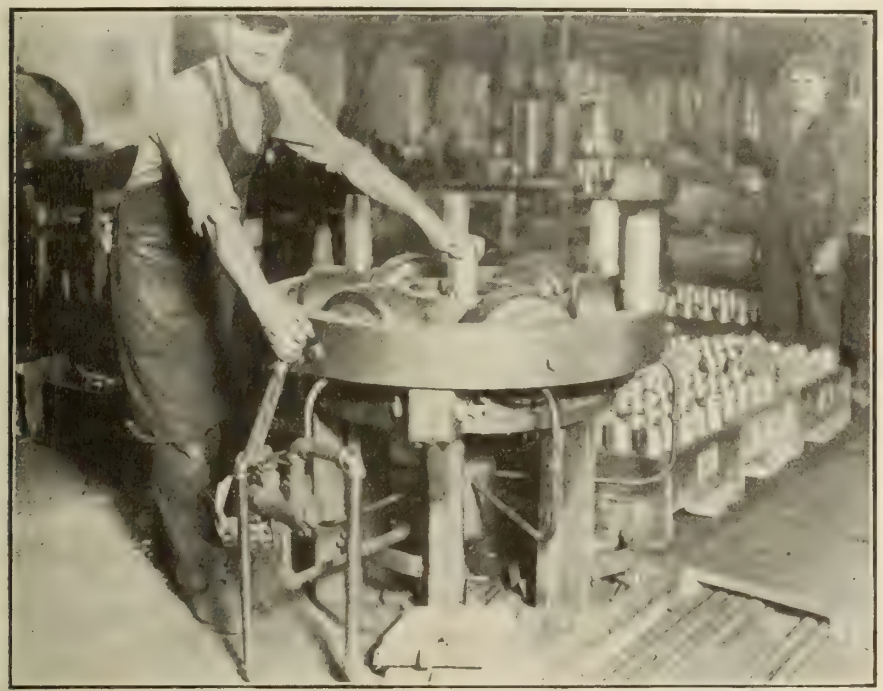

FIG. 15—GOLDIE & McCULLOUGH CO. BANDING PRESS IN OPERATION.

### Heat Treatment.

Before any more machine operations are done on the shell, it passes to the heat treatment department. There are two Canadian-Hoskins oil furnaces in this department, each capable of holding eight shells in a batch. The furnaces are shown in Fig. 9. The shells are placed in the furnaces with a pair of tongs and allowed to remain there from fifteen to twenty minutes, during which time they are heated to about 1,450° F. The shells are then removed from the furnace by tongs and placed in a tank of whale oil and quenched. These tanks are merely square vessels of boiler plate and were built in the boiler department of the works.

When the shell is quenched it is picked out of the oil tanks by tongs and placed on a wire gauze shelf to allow the oil to drain from it, the oil being collected in a sheet metal hopper below. Later, the last traces of surplus oil are removed by tumbling the shells in boxes of sawdust. The shells now pass on to the annealing furnaces, after which they are put on a wooden taper mandrel driven from an old emery grinder. They are here cleaned up and all scale removed. The shell is next tested for hardness with a Shore scleroscope, being afterwards taken back to the heat treating department, where the nose is heated in a lead pot to about 1,400° F. The lead is kept hot by means of a Hoskins oil furnace. The shells are placed over two rods which project out of the metal the necessary amount to give the proper depth of immersion to the nose of the shell. Powdered charcoal is spread on the top of the molten lead to reduce the radiation and oxidation, and also to reduce the tendency of the lead to adhere to the steel shell.

When the nose is heated, the shell is placed in the nosing press, shown in Fig. 4, Plate II. This machine was built by the Goldie & McCulloch Co., and is hydraulically operated. Hydraulic pressure is obtained from a vertical two-cylinder pump, belt driven from the line shaft of the shop. The pump discharges into an accumulator which is equipped with an automatic cut-out, which controls the water supply to the pump. Before closing in the nose, the steel disc in diaphragm is placed in the shell, it being of too large a diameter to pass through the nose after it has been closed in. Immediately the nose has been closed in, the shell is taken from the nosing press with a pair of tongs, and the nose is placed in the lead pot again for a short time to remove all traces of chill caused by the nosing process. The shell is then allowed to cool slowly in the air.

### Finishing Inside of Nose.

When the shell comes to the engine lathes for the finishing of the inside of the nose, the steel diaphragns inside of the shell might possibly come down into the nose and get fouled with the tools, so, to prevent this occurring colored cotton waste is packed into the shell which holds the diaphragm to back end of the shell. Fig. 11 shows the shell in an engine lathe being machined, and as will be seen, the shell is clamped in a hinged chuck which has been bolted to the face plate of the lathe. The chuck has been bored, so that the shell when slid into it is pushed up against a stop, and when the nuts are tightened on the clamping bolts, the shell is firmly held in position. The lathe has been fitted with an improvised turret tool post on the carriage, the details of contruction of which, are clearly seen.

The first operation is the final facing of the end of the nose. The carriage is run up against a stop clamped to the ways of the lathe and, when the carriage is thus placed, the tool is run across the face of the nose and the shell faced to length. Next, the turret tool post is swung around, and the tool for boring the inside of nose is swung into position. The cross slide is run across the carriage until it is against a stop, and, when the cross slide is in this position, the boring tool is correctly located to bore the nose roughly to size.

In the same boring bar is fitted a two-edge reamer, this tool being so placed that soon after the boring tool passes out of the cut, this reamer follows and reams the nose to size. The bar is shown quite distinctly in Fig. 11.

The next operation is to turn the inside of the nose and form it for some distance

FIG. 21.

behind the portion which was bored straight in the operation just described. This is being accomplished in Fig. 11. The tool slide has a fixture bolted to it which extends towards the face plate of the lathe, as can be easily seen in Fig. 11. In the end of this fixture, a hardened steel pin is placed. Another fixture is bolted to the ways of the lathe and on the top of this fixture is screwed a piece of flat machinery steel about one inch thick, and one side of this is ground to the exact profile to which it is desired to turn the inside of the nose. This steel has been

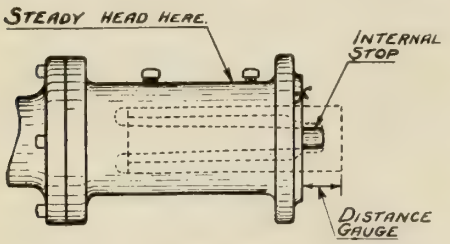

FIG. 22.

hardened. The boring tool in the bar is fed into the nose and then the cross-slide is moved toward the operator and the little hardened steel pin in the fixture in the cross slide is brought up against the curved profile of the piece of steel on the fixture bolted to the ways of the lathe. Thus, the tool is located. The carriage is traveled toward the face plate by the power-driven feed screw and the operator keeps the cross slide pin firmly against the steel template by applying a constant pressure to the handwheel connected to the cross feed screw. Thus the proper profile is turned.

The next operation is to tap the end of the nose, but owing to the fact that the speed of the lathe must be lessened for this operation it is not done at this time. Ten shells are finished up to this point and then each is removed from the chuck. Upon completing the tenth shell the operator changes his lathe speed and runs-in a collapsible tap usually fastened in the tailstock spindle. The other nine shells are rechucked and tapped, thus completing the operation. Several lathes are fitted up with similar tooling and all are doing good work.

Fig. 3, Plate II, shows a Can. Machy. Corporation turret lathe tooled up similarly to that just described, and is shown with the collapsible tap mounted on one of the turret bars and just entering the shell. It will also be noted that this chuck is similar to that on the other lathe, just described.

From these machines the shells are taken to a McDougall vertical drill press which is fitted with a collapsible tap in the spindle. On the drill table a hinged chuck is placed into which the shell is put and clamped there. A tap is run through the nose again to ensure the thread being the proper diameter. This last tap is kept adjusted to within the closest limits and it ensures all the threads in the noses being practically uniform.

**Finish Turning and Grinding.**

The shells now all pass to a table where steel plugs are fitted into the noses. The plugs have a square shank extension in which a centre is located. The plugs being screwed home solidly, the shells are then taken to certain lathes where they are turned, the lathes used for this work being all specially fitted up. They are all equipped with compound rests, and the crossfeed screw is disconnected. To the frame of the lathe at the back, a long piece of flat machinery steel is bolted by means of a couple of brackets, and one edge of this steel piece is ground to the the exact contour or profile of the shell, and hardened. At the back of the cross slide of the lathe is a fixture, on the end of which is a hardened steel point, and this is kept in register with the profile of the steel template by either of two means. The first is by placing two little sheaves on the rear edge of the carriage and having two weights attached to the two ends of a piece of small steel rope, and this rope is led over the sheaves and attached to the cross slide. The other method is to have a couple of springs made of coarse steel spring wire to keep the cross slide closely following the template. All tool adjustments are made by means of the compound rest feed screw.

The production policy has been not to remove too much metal during the first rough turning operation on the J. & L. turrets, because, during the succeeding operations, the metal might become warped and not true up to the finished diameter. Two lathes are fitted up in the manner indicated, and the shells are brought to these lathes for a second roughing cut with an extremely coarse feed at the highest possible speed, the shell being rough-turned to the exact finished profile and to within a very close margin of the finished diameter. The shell is placed in a solid chuck up against a stop, and a set screw clamps down a little wedge-shaped piece of brass by which it

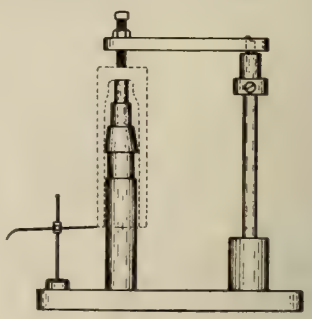

FIG. 23.

is held and driven. This chuck is shown in Fig. 28. In both of these rough turning lathes a heavy steel spring is used to keep the cross slide up to the profile of the templet. The first lathe is a Bertram machine and the spring is made of square spring steel while the second is a David Pond machine with a round steel spring to keep the cross slide in position.

From here the shells pass on to the final turning or grinding, the former being accomplished in much the same manner as described in the rough turning and forming operation. Fig. 14 shows two Stevens lathes tooled up for finish turning, the profile of the steel template at the rear of the lathe to the left being easily distinguishable, also the hardened steel pilot. These two machines are arranged for one-man operation. The lathes equipped for final turning are all arranged in pairs and one machinist always runs two machines. All are equipped with solid chucks, each

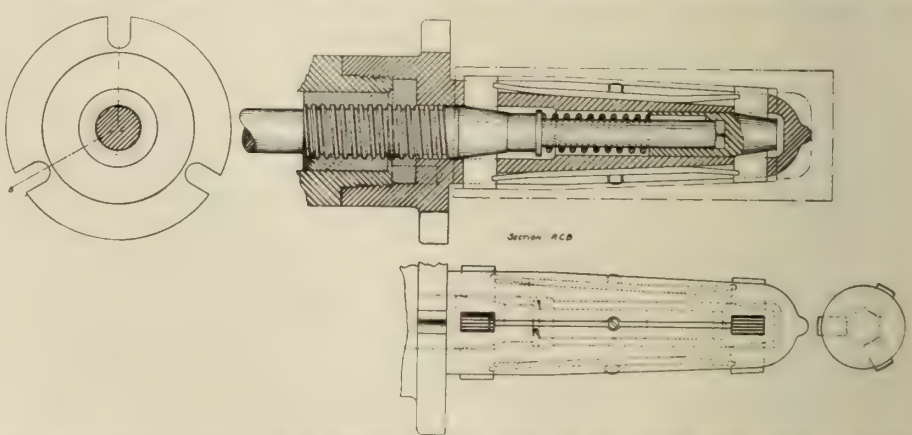

FIG. 24—R. McDOUGALL EXPANDING CHUCK FOR 18-PDR. SHRAPNEL SHELL WORK.

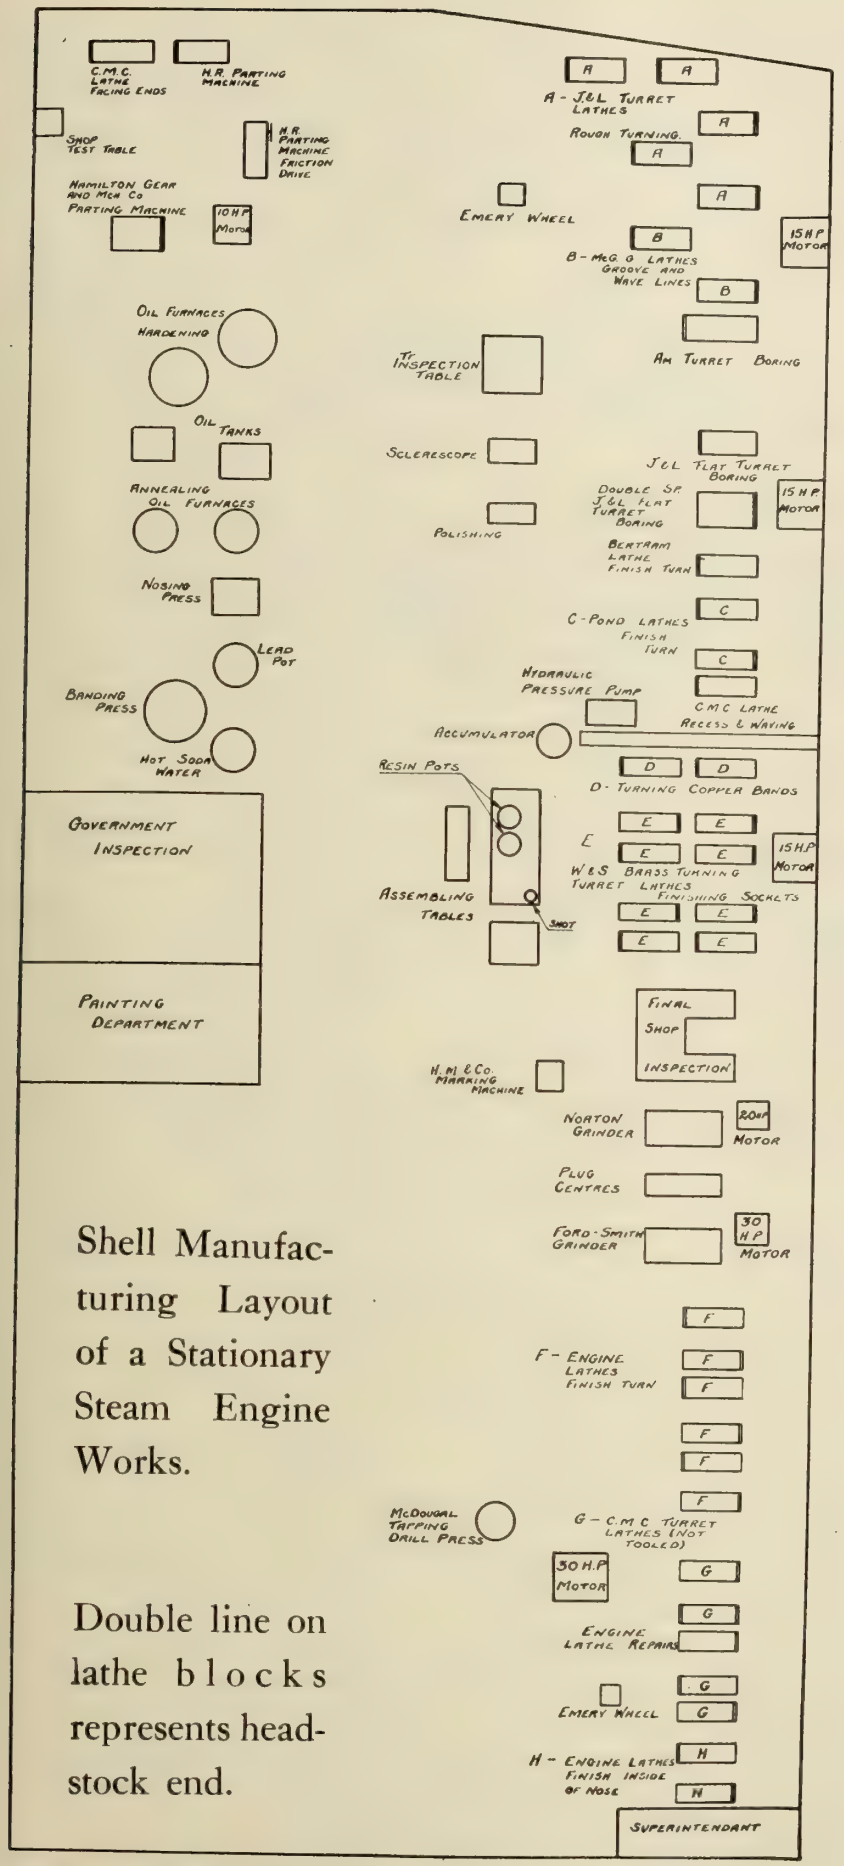

SHELL MANUFACTURING—LAYOUT OF A STATIONARY STEAM ENGINE WORKS.

having a brass wedge set by a set-screw, the shells being placed up against a stop in each case. The shells are carefully calipered and all tool adjustments are made by means of the compound rest. Special attention is given to the grinding of the tools so that a clean cut and a smooth finish be obtained. The final cuts are made dry.

There are two grinding machines upon which the shells are finished to diameter in two operations. The grinding is done in two operations on the same machine; the first is the body grinding and the second is the nose grinding. The bodies of forty shells are ground, and then the noses are ground on the same number. It takes some few minutes to change the wheels on the grinder so it is proposed to raise the number in a batch from forty to one hundred and twenty. On the body grind an 8-inch wheel is used, and this is frequently dressed with a diamond. The nose is ground with a narrow face wheel which has been dressed to the proper curve to give the correct form to the nose. The first machine is of Norton make, and is driven by an individual 20 h.p., 220 volt, d.c. Westinghouse motor. The small end of the shell is the driver and a dog is fitted over the square end of the plug centre which is inserted in the shell. The other end of the shell is supported in a revolving centre. The second grinder is a Ford-Smith machine, and it is driven by its own 30 h.p., 220 volt, d.c. Westinghouse motor. The back end of the shell is placed in a chuck in this machine and the other end is supported by the tailstock spindle. Fig. 6, Plate II, gives a view of this machine and also shows two finished ground shells on the machine to the left. A little difficulty was at first experienced in getting the shells ground true, but later results have been entirely satisfactory.

The shell now has the wave lines nicked in three places with a cold chisel to allow any air trapped between the ribbed lines as the bands are pressed on, to escape and let the copper band fill the central space entirely. It then passes into the hands of the Government inspectors, for a preliminary inspection, the machine work on the shell proper, having been accomplished.

**Pressing and Turning Copper Bands.**

The shells are next taken to the hydraulic banding press which is a product of the Goldie & McCulloch Co. This press is situated near the nosing press and receives its water under pressure from the same tank and accumulator that serves the nosing press. The copper band is slipped over the end of the shell and is struck a hammer blow which causes it to go into the groove or recess and remain there. The operator then places the shell in the machine, the six jaws of which closely press the cop-

per into the undercut edges and imbed the waved lines into the copper band. The jaws being released, the shell is turned slightly, after which the jaws again close on the band. This insures the band being driven home for keeps. Fig. 15 shows the banding press and two shells with the copper bands pressed on them. The shells are now taken to the band turning lathes, and the nose end is placed in a chuck, Fig. 5, Plate II. The shell is placed up against a stop in the chuck and to the turret is attached a revolving centre. The cutting tool is ground to the profile of the rifling band and is fed into the work. The proper diameter is determined by means of a pair of calipers or a limit snap gauge. Two lathes are fitted up to do this work.

### Assembling.

The shells next go to the assembling department. The tin powder cups are here placed in the powder pocket, and the brass powder tube is screwed into the diaphragm and the powder cup. The shot filling is the next operation. Fig. 8, Plate II, shows this. Steam pipes can be seen leading down into the shot box so as to keep the bullets warm. The shell is placed on an air vibrator and a funnel placed in the nose end. This funnel is shown in Fig. 29. The central rod runs down the powder tube and centres it, while the turned portion on the bottom

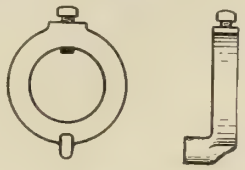

FIG. 25.

of the outside of the funnel just fits inside the threaded nose. The shells are jarred down by the air vibrator and are afterwards put on a balance and weighed. Thus the proper number of shot is determined by weight rather than by a mechanical measurement of the volume.

The shell is now put under the resin pots, which are heated by gas burners, and filled with molten resin. The warm shot keeps the resin fluid until it fills the shell spaces completely. Small wooden plugs are placed in the powder tubes to prevent the resin from getting in them. The resin pots are shown in Fig. 8, Plate II. The shells are again weighed, and one or two pieces of buck-shot are added to secure the correct weight. When the shell is of the proper weight, the brass socket is screwed on, but before doing so, its thread is coated with red lead. The socket is inserted a turn or two by hand and then the shell is clamped in a hinged vise and a 24-in. pair of pipe tongs are used to screw the brass socket home. A little steel plate is placed over the top jaws of the tongs to keep them from slipping down and injuring the finished steel portion of the shell. As the brass socket is screwed home, the little powder tube projects through the socket. A little plug of felt on a small wire is let into the powder tube to keep dirt out of it, these felt plugs being cut with a belt punch.

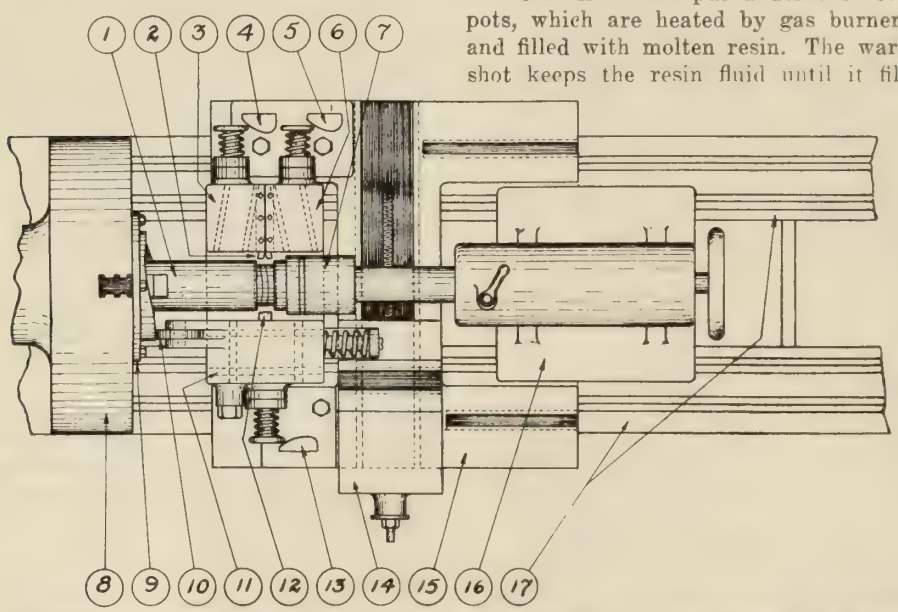

FIG. 26.—DIAGRAM ILLUSTRATING THE BERTRAM ATTACHMENT FOR RECESSING AND FORMING WAVE LINES IN THE GROOVE FOR THE COPPER RIFLING BANDS ON AN 18 PD. BRITISH SHRAPNEL SHELL. KEY FOLLOWS:—

(1)—18-pdr. Shell Forging.

(2)—Tools for cutting the outside edges of the recess to depth and under-cutting the edges. Tools are fed in at an angle to the work as the tool holders are mounted on an inclined dove-tailed slide as indicated by the dotted lines.

(3)—Tool holder mounted on a dove-tail slide which feeds the tool in at an angle to the work. Bottom of slide clamped to lathe bed.

(4)—Cam mounted on a fixture which is bolted to the carriage of the lathe and as the carriage is travelled toward the head stock of the lathe the cam pushes the tool holder (3) inwards thus feeding the tool into the work, at an angle so that the edges of the groove will be undercut.

(5)—Same as (4) but it feeds in the tool that cuts the other edge of the recess.

(6)—Same as (3) holding tool for the opposite side of the groove.

(7)—Revolving centre on tail stock spindle.

(8)—Lathe chuck on live spindle.

(9)—Steel face cam bolted to the face of the chuck.

(10)—Roller which is kept against the face cam by the square steel spiral sprnig. This roller oscillates the tool holder (11).

(11)—Tool holder for wave line forming tool.

(12)—Wave line forming tool.

(13)—Cam for feeding wave forming tool into the work. Tool holder (11) is a compound holder. The top portion is mounted on a dove-tail slide which is parallel to the ways of the lathe. The second or middle portion of the holder is mounted on a dove-tail slide which is at right angles to the ways of the lathe. The bottom portion of the slide is clamped rigidly to the lathe bed. The cam is mounted on the lathe carriage and as the carriage is moved toward the head stock the cam feeds the tool into the work and the face cam on the chuck oscillates the top portion of the tool holder, to which the tool is clamped, thus forming the wave lines and cleaning up the central portion of the bottom of the recess.

(14)—Cross Slide. (15)—Carriage. (16) Tail Stock. (17)—Ways of lathe.

The powder tube is next soldered to the socket. The soldering irons are of a special shape, and are kept hot in electric pots of molten solder. Thus, the soldering iron has a supply of solder on it when withdrawn from the solder pot. A further supply of solder is, however, added by means of a piece of wire solder coming up through a hole in the assembling table. This is also applied to the hot soldering iron. The shell is now assembled and goes to the brass turning lathes to have the socket finished up.

### Finishing Brass Sockets.

This operation is accomplished on several Warner & Swasey and MacGreggor-Gourlay turret lathes speeded up so as to be able to turn brass to advantage. The shell is placed in self-centering chucks of various types and the blank end securely gripped. It is further supported by a steady rest as will be seen in Fig. 2, Plate II. The first operation is to clean up the projecting end of the powder tube and cut it off flush with the bottom of the socket. This is done with an L-shaped tool, and is a simple operation.

The outside rim of the brass socket has up to the present never had the scale removed from it. The next operation rough turns this rim to somewhat near the finished size and form. The turret is swung around to bring this tool into position, and at the end of this operation the turret is again swung, this final movement bringing a tool into position, the cutting edge of which is ground to the proper profile of the finished socket. This tool is fed into the work and forms the outside curve of the socket. Still another operation is, however, necessary. The extreme outside edge of the socket is turned down to a slightly smaller diameter than this last tool cuts the socket. Thus, another swing of the

turret brings this tool in position and the final cut on the outside of the socket is made and at the same time the end of the socket is faced. Thus, a little shoulder is formed, the distance of which from the end of the nose has to be carefully gauged. The nose is not faced off square but the inside is bevelled so as to produce a better seat for the timing fuse when it is finally placed on the shell.

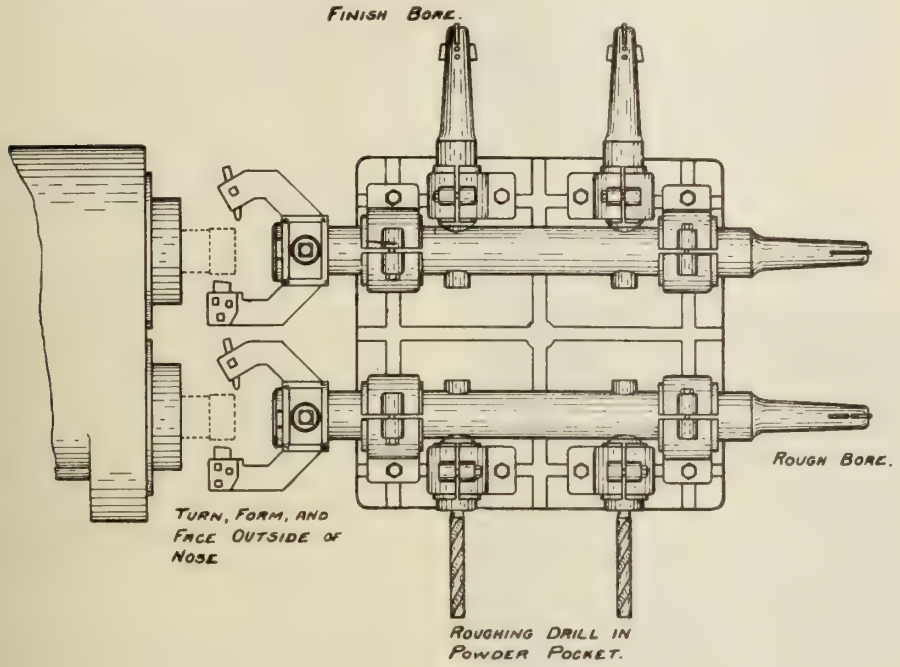

FIG. 27—TOOLING OF DOUBLE SPINDLE FLAT TURRET LATHE.

### Final Operations and Painting.

The shell now passes into the final shop inspection department, this being shown in Fig. 1, Plate II. Here a tap is run in the nose of the brass socket to clean out any burrs that the finishing operations of the socket have left in the threads. The form of the seat for the timing fuse is also gauged. A little tap is then run through the small hole in the side of the socket, where a little grub-screw is placed to hold the timing fuse in any required position.

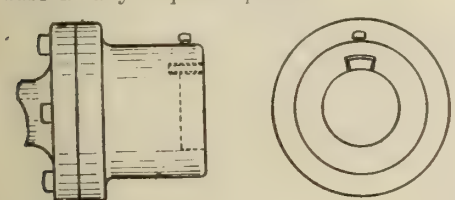

FIG. 28.

Next the felt plug is taken from the powder tube and then the powder tube is reamed to clean up any burrs which may have been left on its edges. Then a rag on a little steel rod is run into the powder tube to clean out any chips. The shells are weighed again on a delicate pair of scales. The brass caps are next screwed into the sockets and the shell passes on to be marked. Ordinarily, the shells are marked on a special Holden-Morgan marking machine, but, owing to this machine being moved to a new position the men are seen in Fig. 1, Plate II, marking the shells by hand.

Fig. 7, Plate II, shows the painting department in the foreground. The shells are painted by hand after having passed through the final Government inspection, which department is shown in the background of the same figure.

### CANADIAN SHELL COMMITTEE.

**The personnel of the committee entrusted with the placing of orders for shells, etc., and the inspection and shipment of same is representative of both Canadian military and manufacturing interests, and is individually as follows:**

**David Carnegie, M.I.C.E., Ordnance Advisor.**

**Brig.-Gen. Alexander Bertram, Chairman of Committee.**

**Brig.-Gen. T. Benson, Master General of Ordnance.**

**Lieut.-Col. Thomas Cantley.**

**Lieut.-Col. C. G. Harston, Chief Inspector of Arms and Ammunition.**

**George W. Watts.**

**Lieut.-Col. F. D. Lafferty, R.C.A., Supt. Dominion Arsenal.**

**E. Carnegie.**

**J. W. Borden, Accountant and Paymaster-General, Militia Dept.**

**The Shell Committee Headquarters is Drummond Building, Montreal.**

### General.

All machines are belt-driven from line-shafts or counter-shafts. The prime movers are 220-volt, d.c. Westinghouse motors placed in timber cages suspended from the ceiling timbers. The shells are transported about the shop on platforms each containing forty shells, and these platforms are built to be accommodated by the Cowan and Chapman transfer trucks are employed for the purpose.

Only 18-lb. shells are machined in this plant, which thus only requires one set of tooling. The size of the shop is 200 feet x 60 feet approximately. Three shifts of men per twenty-four hours are worked. Each shift works eight hours with a twenty-minute interval at the end of each four hours. Thus, the shop actually works twenty-three hours out of the twenty-four. The operators are paid a certain sum per hour for their work, and the superintendent has assigned a certain production number to each machine, and if the operator exceeds this number during his shift, he receives a bonus for each additional shell machined.

The natural lighting of the shop is by means of windows in the side walls and a very generous monitor composed mostly of glass. Incandescent tungsten lamps of high power are used for artificial lighting. Each machine is also provided with a drop light.

A thorough system of shop inspection in conjunction with careful supervision has enabled the plant to have become eminently successful in this work. The daily output at present is about six hundred shells.

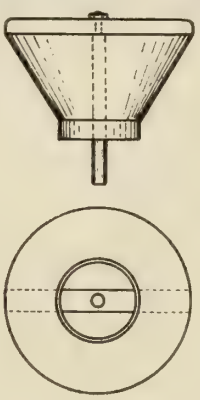

FIG. 29.

**Countermining.**—This consists of destroying a marine mine-field by the laying of a fresh line of mines across it and exploding them. An ordinary line of countermines would number fourteen 500 lb. mines. These are laid by specially built boats which are towed by fast steamers across the field, or by specially built launches. The work is extremely hazardous because of the danger of both mine explosion and of enemy gun fire.

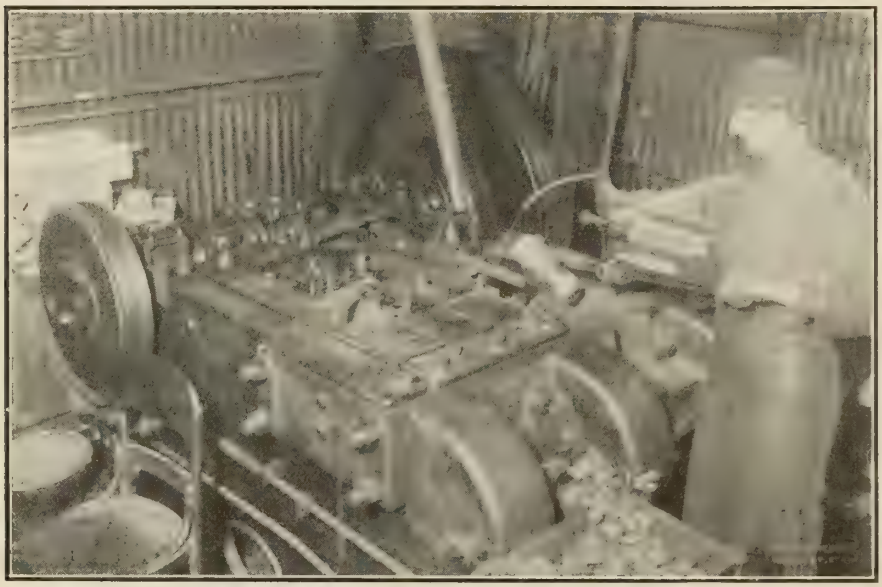
# Shell Manufacture in an Electrical Engineering Plant

Staff Article

*Uncertain as to the duration of the war, but with the desire to bear a part in furnishing our Empire with munitions of war while maintaining its normal manufacturing equipment practically intact, the institution here described has, by the investment of a small amount of capital and by drawing on the skill and aptitude of its staff, succeeded in achieving a highly satisfactory degree of success in the matter of shrapnel shell quality and quantity output.*

THE accompanying photos and description are those of a plant whose normal equipment is particularly unsuited to the manufacture of shrapnel. At the time of the outbreak of the war, certain departments were very short of work, and the object of undertaking the shell business was not to make a specialty of it, but to fulfil a duty to the Empire and to the Dominion by keeping as many men employed as possible. The necessity of preventing interference with such regular work as is being done and of doing the work wherever the machines and appliances are available, has made impossible the adoption of any progressive system in the organization of the shell department. Much time and labor is lost in transferring the product from one department to another, which are, at times, considerable distances apart; further, the shell work must be done without disarranging in any way an otherwise carefully planned organization for the regular product.

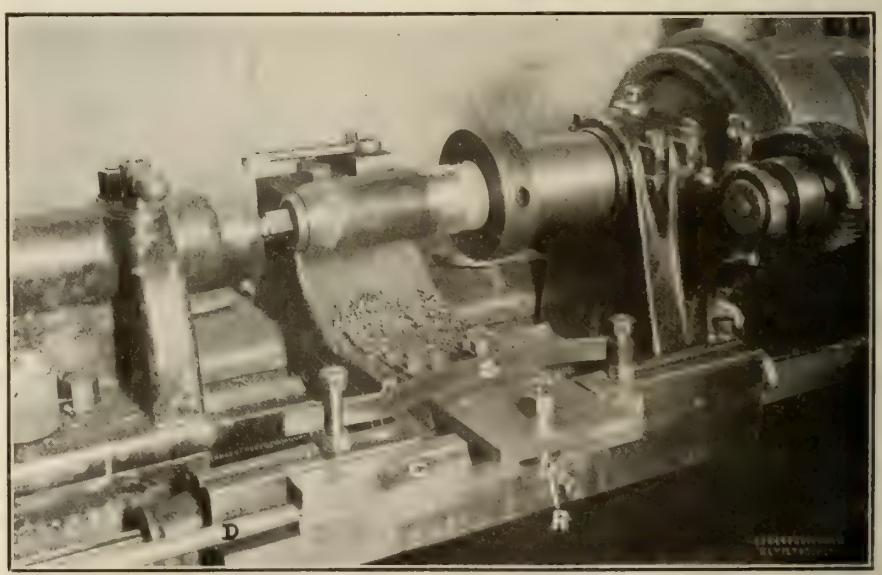
In spite of these and the natural difficulties, the undertaking as a whole has not only paid the overhead charges, but has been made a paying business. Very little, indeed, has been spent in extra equipment, and even though some of the improvised methods do not pay directly, the standard machines are paying their upkeep in time of stress. The staff is being held, money is kept in circulation, and our soldiers at the front are being well supplied with thoroughly reliable "goods." Taking all results into account, the officials of such a concern are deserving of considerable credit, which, on account of a pre-arranged plan of unobtrusiveness, will most likely be denied them.



NOSING SHELLS ON "ACME" FORGING PRESS.

The shell forgings are received from the steel plant by car loads in the usual way, and must first be ground on the ends and inspected for imperfections. Both ends of the forging have considerable excess metal to be removed, and most efforts to do this simultaneously by milling cutters have been unsuccessful. In the plant under consideration, the front or open ends are efficiently trimmed in an ordinary cutting-off machine, equipped with two cutters, while the back ends are faced on a pair of New Britain automatics. The rough turning of the body, and the finishing of the back end up to the groove for the rotating band, is done on a number of machines, including several Jones & Lamson turret lathes, a Warner & Swasey, and a Bullard boring and turning mill, the work being located by the inside upon an arbor.

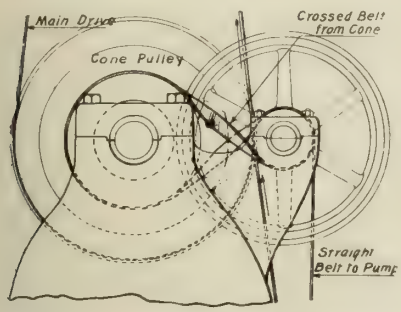
With the latter machine, it has been found most economical to do the rough facing at the same setting as the turning, which is carried up to the part which forms the nose. Two Reed-Prentice turret lathes, and one or two others equipped with Celfor high-speed drills of suitable form, are used to bore the powder chamber and diaphragm seat in one rough and one finishing operation. In this connection, there is used a very simple and effective method of producing a continuous flow of cutting compound to the tool. The work is driven directly by the belt, leaving the back gear free. One of the cone steps not in use is cross-belted to the idle back gear hub, from which another belt drives a



FORMING ATTACHMENT FOR ROUGH TURNING SHELL NOSE.

small centrifugal pump located at the base of the machine, and whose speed of rotation, and hence the supply of compound, can be varied by belting from a larger or smaller step of the cone.

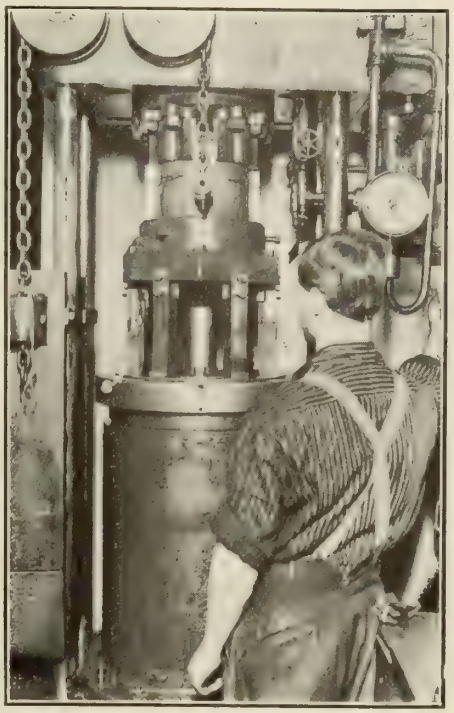
The treatment of the seat for the rotating band consists of three operations, i.e., grooving, waving and under-cutting. These are performed on three standard American lathes, equipped with face-cams bolted to the backs of the chucks, which give the carriage the necessary lateral motion. This is traversed by a hardened steel roller, attached to the



PUMP DRIVE FROM CONE OF STANDARD LATHE.

carriage, and held to the surface of the cam by springs. After rough turning, the shells go to the furnace for heat treatment. For this purpose several oil furnaces have been built, one each for heating and annealing in particular, having a capacity for a large number. The shells, after having been treated with boracic acid to prevent oxidation, are heated uniformly to the hardening temperature, and then dipped in the oil, open end first. From this they are transferred to the annealing furnace in sheet metal trays for convenient handling, and are raised to a temperature of 1,200 degs. F.

After the scleroscopic test for hardness, the shells are made up into groups or series of 120, from which the Government representative selects one for the tensile test, and another for the firing proof, leaving 118 to the credit of the plant. The open ends are now heated in a lead bath to a temperature of 1,500



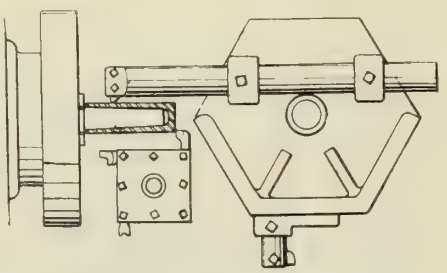
QUICK ACTION HYDRAULIC PRESS TRANSFORMED INTO A BANDING PRESS.

degs. F. for the nosing operation, which is performed in an Acme forging machine. This method of nosing the shells, although at first the outcome of acute necessity, as there was no other suitable press in convenient proximity to the heating department, has been very successful indeed. The press has quicker action than most geared presses, and required very slight alterations for this work. The diaphragm, instead of being dropped into the shell, is placed upon the end of a rod which enters the shell in advance of the closing operation, and this keeps the disc well back out of the way of the die.

The shells now go back to the lathes for the next series of operations, which consists of boring, facing, recessing, and tapping the nose for the socket. For these operations a number of lathes are utilized, including Reed-Prentice, Canada Machinery Corporation, and others. The recessing is here done by means of a formed flat tool supported on a short boring bar from a monitor turret. It is necessary that the shell walls be of a certain thickness at this point, as well as conform to a curvature of specified form. The tapping of the nose to receive the socket is done on a single small Warner & Swasey lathe, using a collapsible tap and a quick-acting, self centreing chuck. This has been found to be rapid and economical, and moreover, a single tap does all the work.

### Form Turning.

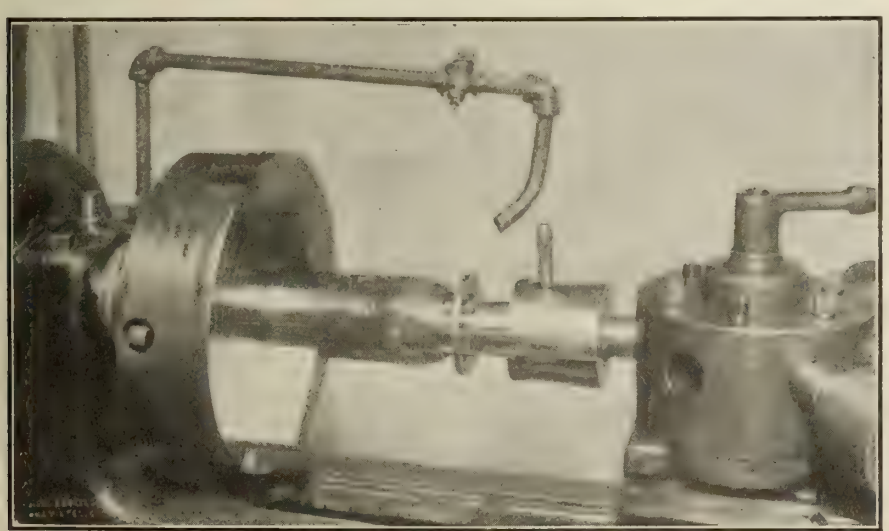
Next in order is the operation of rough turning the formed shell nose. The best results have been obtained from those not equipped with taper attachments. The vertical face at the back of the lathe carriage is faced off on a planer, and to this are attached guides for the forming cam bar. This cam, shown at C in the illustration, and on one side of which is worked the profile of the shell nose, is held fast by an adjustable rod, B, to



SIMPLE AND EFFICIENT ARRANGEMENT FOR ROUGH TURNING AND GROOVING.

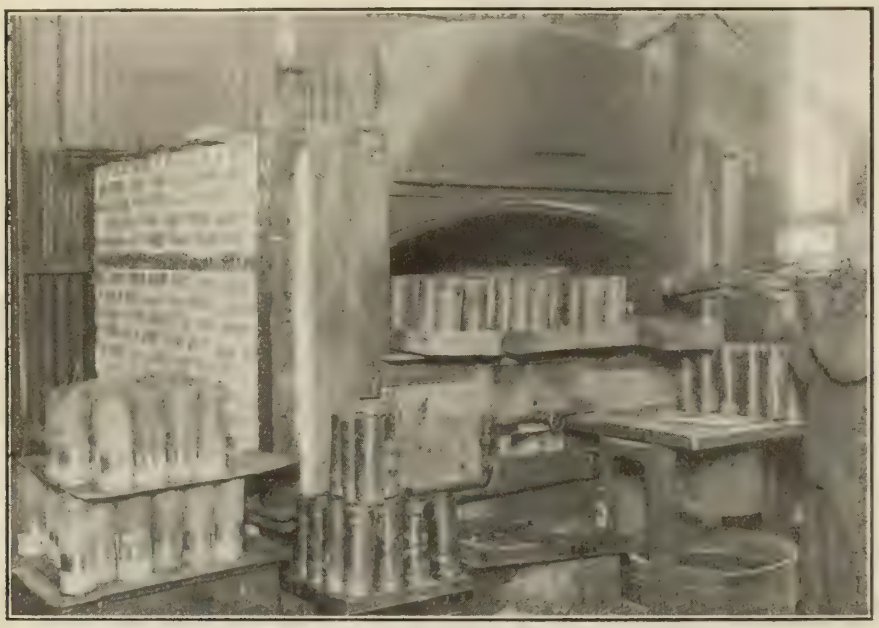
the lathe bed, and, as the carriage moves back and forth, the roller R attached to the cross slide, imparts to it a lateral motion, which combined with the lengthwise motion of the lathe carriage, guides the tool so as to give the correct contour to the work. The roller and cam are protected from dirt and interference by the over-hanging extension to the cross-slide, and a neat flat spring, S, serves to keep them in continuous and close contact.

In the case of lathes fitted with a taper attachment, the taper guide bar is replaced by a plate in which a cam groove has been cut to suit the roller on the cross slide. This requires a weight to keep the roller up to the guiding face; the forming cam is more expensive to make, and the whole arrangement is less simple and less solid than the previously described method.



TAPPING FOR SOCKETS WITH COLLAPSIBLE TAP.

A considerable amount of difficulty was at first experienced in this, and in the rough turning of the cylindrical part of the shell. On account of the segregation of manganese and other causes, hard spots and in some cases considerable hard areas are often encountered,



ANNEALING SHELLS IN QUANTITY BEFORE NOSING.

which resist all application of the lathe tool. The men engaged in this part of the work, however, have found that the troublesome shells can be sorted out by striking them in a certain way, and noting the sound given out. The hard shells go straight to the grinders for both roughing and finishing operations, and little time and effort is lost to the lathe man.

The grinding employs three Modern Tool Co., and one Ford-Smith machine. The methods adopted by the makers of these machines are carried out in either case. As is well known, the grinding of the shell on the Modern grinder is accomplished in two operations. First, the hardened cylindrical surface from the groove to the nose is finished by a flat wheel of the full width without traverse. The nose is ground in the same way in a subsequent operation on a formed wheel 2 ins. in width of face, and of a grade suitable for the softer material. The Ford-Smith machine is designed to finish the whole surface of the shell at a single operation by means of one formed wheel. The most interesting part of this equipment is the wheel itself, which is of varying bond and grit throughout its length of face to accommodate the different degrees of hardness of the heat-treated shell.

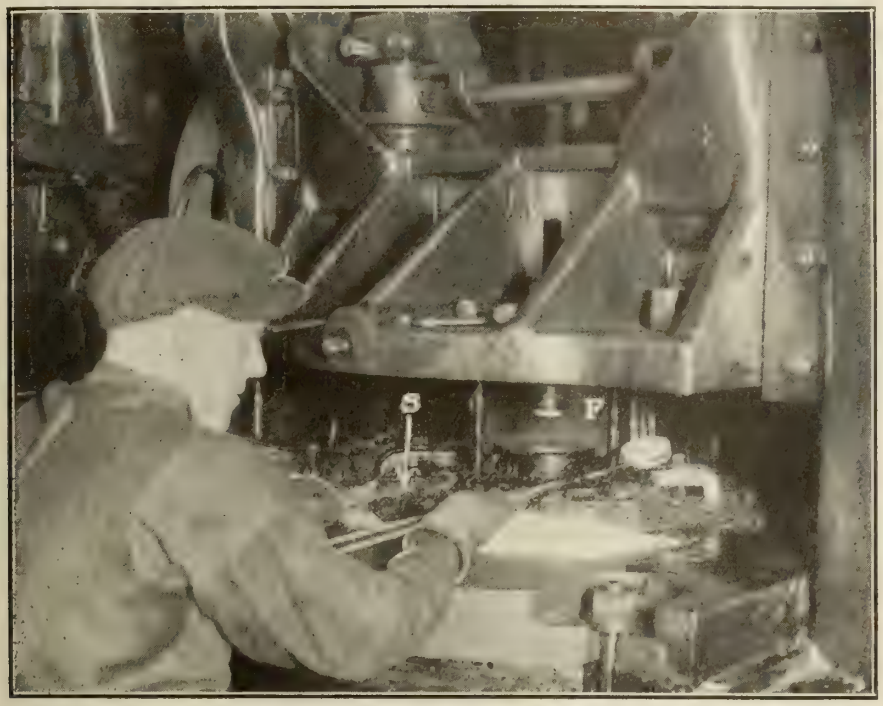
SINGLE PYROMETER DIAL ARRANGED TO SHOW TEMPERATURE OF ANY FURNACE.

As to the results gained by this arrangement, definite reports are not yet

ONE OF THE CONTINUOUS MELTING BRASS FURNACES.

CONTINUOUS POURING OF SLUGS FOR SOCKETS AND CAPS.

available. The form-grinding proposition has really resolved itself into a diamond problem, and the best solution of the grinding process offered up to the present time, is that the cleaning, and as much of the truing as possible, be done with the common disc type of wheel dresser, and that the diamond be used only for the finishing touches. The provision of an economical device for keeping the wheel to an accurate form would certainly add much to establish the supremacy of the grinding wheel in this work, as the question of power, speed, and wheel manufacture have been satisfactorily met. Considerable care is required when two operations are employed, to obtain a smooth continuous surface at the intersection of the two grinds.



FORGING SOCKETS FROM BRASS SLUGS.

**Shell Banding Feature.**

The shells now receive the first Government inspection, after which they are taken to the banding press. For the banding operation a hydraulic arbor press is utilized. The ram is fitted with six wedge cams as shown in the illustration. As these descend, a corresponding number of radial bars are forced by the wedge action towards the centre, and against the band to be closed. The reaction of the wedges is taken by the brass shoes S.S. and the bars are returned to the outside positions by springs. The ends of the slide bars which operate on the band are so shaped that the edges are pressed slightly harder than the central part, which ensures that the copper will be thoroughly forced into the under-cut. Two actions of the plunger complete the operation.

The bands are turned to the required shape by means of a special formed tool of the flat type, the circular formed tool having been found unsatisfactory for operating on the soft metal, as it is difficult to obtain the sharp clearance required. This work is done in small standard lathes, equipped with a special centreing chuck to hold the shell by the rear end, the front end being supported by a centre plug screwed in.

The steel case is now complete except for the marking which is done immediately before or after the banding operation. This is largely done by hand with stamps, but a Bertram marking machine is being installed, which will no doubt greatly expedite this operation.

Assembling the shell with its contents forms the final series of operations. The steel diaphragm disc, to separate the powder from the bullets, has already been inserted at the time of nosing. The tin powder cup is now placed beneath this in the chamber provided for it, and the brass tube is screwed into the diaphragm. The shell is now stood on a vibrator plate, and is kept in rapid quivering motion while the bullets are poured in from a scoop calculated to hold approximately the correct number, which is afterwards tested by weighing the shell.

The open end of the tube is now plugged and the rosin is run in around the bullets from a gas heated pot, with provision for maintaining a uniform melting heat. These pots are also equipped with a steam coil for assisting in heating up the mass of material when beginning work. The complete filling of all the interstices between the bullets is greatly facilitated by the warming of the bullets before these are placed in the shell. The brass sockets are screwed home with a screw plug, and a large tap wrench. The plug is simply a stud fitted with a round nut which, upon being slackened by means of a spanner wrench, releases the stud so that it can easily be removed by hand.

FINISHING SHELL SOCKETS ON SMALL BRASS LATHE.

Soldering the tube end into the socket

is a simple operation with a special form of copper. The sockets are now turned to gauge and the surplus solder cleaned off in small standard lathes equipped with formed tools and steady rests. The shell, as in other operations, is driven by the rear end from a special form of centering chuck. The shell now receives its final shop and government inspections, but is not painted until the results of the firing test are received.

### Painting.

The painting is done on a long table equipped with rails to allow of the shells being rolled along throughout the operation. The final coat is brownish black for the body, and red for the nose, the shell being handled throughout by the rotating band which is not painted. The final act consists of a shop inspection and packing, six to a case, in which they are shipped to the arsenals of France and thence to the battlefields.

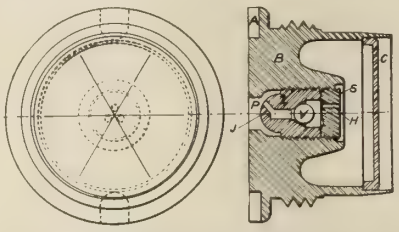
### Making Brass Sockets and Plugs.

The manufacture of the brass sockets and plugs forms a sort of diversion from the main objective. These are made of a brass composition, which is such that the castings cannot be moulded in their final shape. Instead, they are simply poured in the form of slugs in cast iron moulds. As fast as the metal chills, the moulds are emptied so that the process is continuous. To obtain the desired shape and uniformity of metal, the slugs are put through a forging operation. For this purpose a heavy stamping press is employed and the dies required are very simple. In the illustration at F to the rear of the press, the oil furnace in which the slugs are brought to a red heat is shown. Three men are employed. One looks after the heating, a second places the slugs in the die, and a third operates the press and removes the finished forging.

The punch is stripped from the forging by an application of oil by means of the swab S before each stamping. The stripping from the die is accomplished by two rods extending down through the die plate from the upper bolster. The operation is very rapid and either sockets or plugs can be formed practically as fast as they can be conveniently handled. Throughout the whole process, the castings require no cleaning or pickling, the only preparation for the forging being a rough sizing cut over one face. These parts are finished rapidly in the usual way on small monitor brass lathes, and are fully inspected by Government officials before leaving the department. The office of the plug is simply to protect the thread for the fuse, and to prevent foreign materials entering the tube until the fuse is placed in position.

## PERCUSSION PRIMERS FOR QUICK-FIRING CARTRIDGE CASES.

AMONG the many incidentals in connection with the manufacture of shells which are being made in Canada in quantities commensurate with the number of shells turned out are percussion primers. These are used in connection with the cartridge cases for the 18-pounder shells. Field guns are of two general types, viz.: Those using fixed ammunition and those using separate



FULL-SIZE SECTION OF BRASS PERCUSSION PRIMER.

ammunition. By fixed ammunition is meant the arrangement of the shell and propellant in a single package which reduces the loading process to a single operation and thus brings the gun into the quick-firing class.

The procedure is as follows: In the leisure time of the gun crew, the powder package is placed in the cartridge case and a shell is slipped into the open end which it fits snugly until it is stopped by the rotating band. A primer is now screwed into the base of the cartridge and the unit is ready for firing.

### RECRUITING FOR MUNITIONS.

**A new recruiting poster has made its appearance all over London, England, calling for recruits of "any age, any measurements, any medical qualifications or disqualifications," so long as they are good mechanics or capable of doing any of the work necessary for turning out war munitions.**

**Men who volunteer for this service will register their names with the recruiting officers, but they will be employed directly by the armament firms, not by the Government. The recruiting officers thus become a sort of labor exchange for the firms which are producing shells, rifles and other necessaries of war. The new poster appeal is headed, "The Man the Army Wants Now," and bears a sketch of an artisan at work.**

The cases may be used for from three to five shots before they become so swelled that they will not enter the gun freely. In order to use a case a second time, the old primer must be removed by a special spanner wrench and a new one put in place.

These consist of several parts, most of which are well suited for rapid production upon automatics. As shown in the accompanying cut, they consist of the body B, the screw plugs L and S, the copper ball V and the closing disc C. The complete assembly consists also of a cap inserted in the space P, and gunpowder in the space below the closing disc and two paper discs.

The body is made on turret lathes or automatic machines from drawn brass rods, and these rods must fulfil the following physical requirements under tensile test: Elastic limit, 12 tons per square inch; ultimate strength, 20 tons per square inch, and an elongation in 2 inches of 30 per cent. The rods are cast in bars about 2 inches in diameter and are reduced by successive drawing and annealing operations to 1 7-16 in. in diameter. After each annealing operation, they are pickled in a sulphuric acid solution of one to four, and then washed in water. The rods may also be formed by the extrusion process. The specified chemical composition is: Lead, 1.77 per cent.; copper, 65.93 per cent., and zinc, 32.2 per cent.

The complete body can be made at a single setting of a good automatic equipped with tap and die for the threads, and, in fact, involves a very interesting set-up. All that remains to be done is the milling on the flange for the spanner and the stamping. The screw-plugs L and S are made in a similar manner, the set-up, of course, being much simpler. The physical requirements of these parts are, however, considerably lower, namely: Elastic limit, 6 tons; ultimate strength, 12 tons; and elongation in 2 inches, 10 per cent. The plug L has three small holes drilled radially into the spherical end which faces the primer cap. The copper ball is approximately one-eighth of an inch in diameter and acts as a valve to prevent the explosion of the main charge acting backwards against the primer cap. The plug S contains three small holes drilled vertically through it, and whose purpose is to allow the flame to reach the powder in the space beyond.

The closing disc C may be either turned from the solid bar or stamped from strip brass, as it must go through a press operation anyway to produce the radial cuts; the latter method is obviously the one to adopt. After filling the large space in the body with R-FG[2] powder under heavy pressure, the edges are spun down over it, and the primer unit is complete. The above term refers to the fineness of the grain of the rifle powder used.

# Manufacturing Shrapnel Shells in a Machine Tool Plant

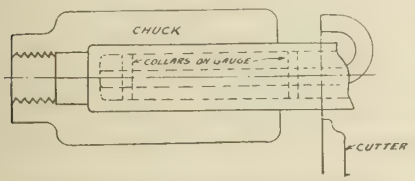
Staff Article

*In this instance it will be observed that the majority of machining operations are performed on standard engine lathes equipped with suitable fixtures and attachments, and that grinding operations have been entirely dispensed with. The product output and quality is and has been such as to make procedure otherwise unnecessary for the present at least.*

AT this particular plant no shell forging is done, the machining and otherwise finishing features constituting, as in the majority of Canadian concerns engaged in the shell business, the contract terms.

**Cutting to length and Squaring Base.**

Omitting the first three operations incidental to taking the shell forgings from the car, placing them in storage,



TRIMMING OPEN END TO LENGTH.

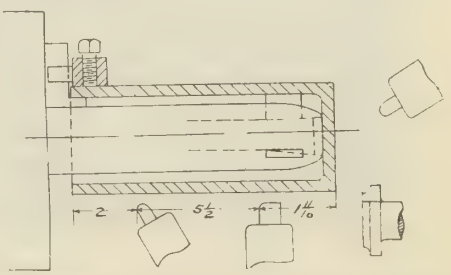
etc., we come to the fourth operation which consists of the preliminary cutting of the forging to length and squaring-up the base. The forging is chucked in an engine lathe and a gauge fitted with two collars and a hooked end is placed inside the shell. After the ragged ends have been cut off, the shells are taken to a vertical boring mill for the bases to be squared up. On the mill table is a special fixture designed to take twenty forgings with a vertical stop for each, over which the shells are placed. The forgings are clamped to the fixture, two to each clamp, and machined, the tool having previously been set to a gauge block between fixture and tool.

**Body Turning and Finishing Base.**

In the fifth operation, the outside of the body of the shell is turned, this being the first turning operation; the base is also finished off. This operation is done on a turn-table lathe fitted with an inside expanding arbor operated by a shaft running through the headstock spindle. The arbor is fitted with expanding jaws for truing the inside of the shell near the base. A three-jaw universal chuck grips the inside of shell which has a driving band fitted with a pin and fastened to the outside by three set screws bearing on the chuck jaws. The first tooling operation is a roughing cut on body of the shell about 7 in. from the base, the next operation being a finishing cut 1 11-16 in. from the base. In the 3rd operation the base is finished, and, with the fourth tool the corner is rounded off. The illustration shows the expanding arbor and tools in the order that they are used. The second tool is brought into play by the lever operating through a quick thread. Seven shells per hour is the capacity of the machine for the foregoing.

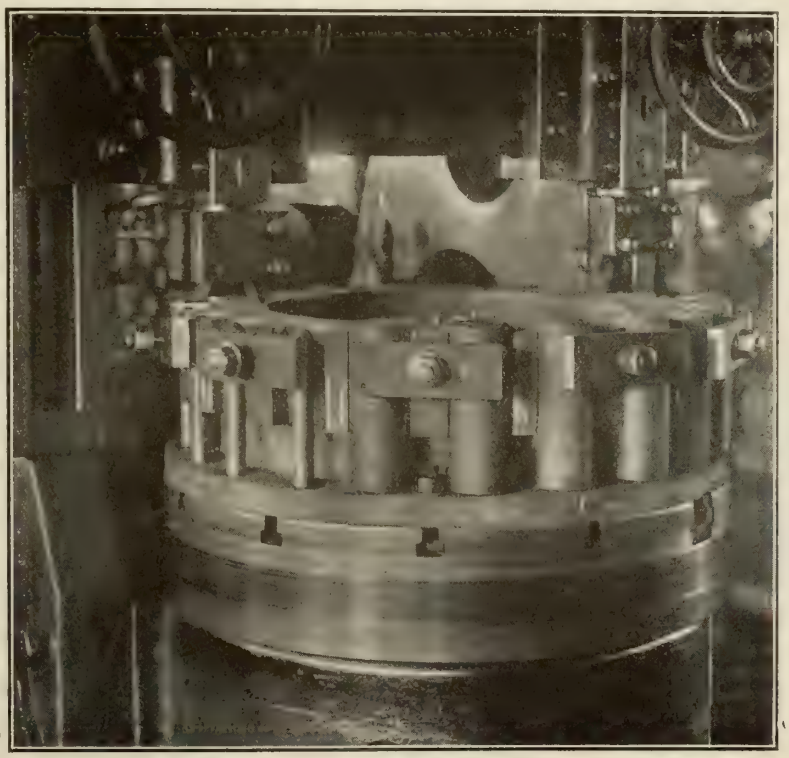
**Machining Powder Pocket.**

The 6th operation consists of boring the powder pocket and facing and boring the diaphragm seat, cutting the shell forging to length and rough turning the nose taper. The machine on which this operation is performed is an engine lathe with saddle and turret attachment. The shell forging is held in a box chuck and the end faced to length by a cutter fixed to a bar on the turret head; a stop on the slide regulates the travel of the tool. The powder pocket is roughed-out by a boring bar fitted with a suitable cutter. The turret is then turned to the next position and a similar tool makes the finishing cut to the powder pocket. The diaphragm seat is next rough bored and faced, after which a similar bar is inserted and the finishing cut made. The



OUTSIDE BODY TURN AND FINISH BASE.

powder pocket finishing boring bar is afterwards used to clean off any ragged edges that may have been left after the diaphragm seat has been machined. All the boring bars have collars attached to act as stops. The nose is now rough turned by an ordinary tool working on a compound rest on the lathe saddle. In this operation, the machining of the inside of the shell is completed with the exception of that part of the inside of the nose which is done at a later stage.

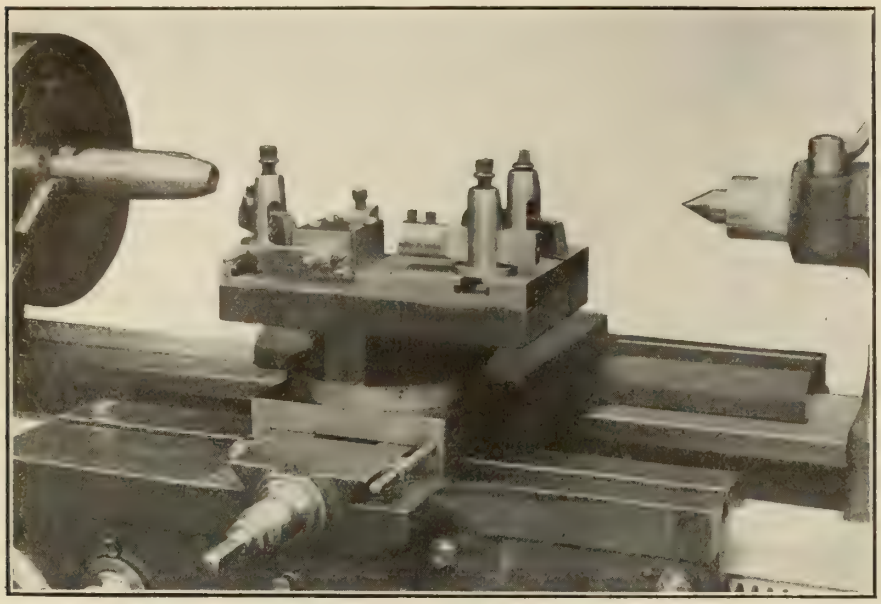


SQUARING SHELL FORGING BASES ON BORING MILL FIXTURE.

**Grooving and Waving.**

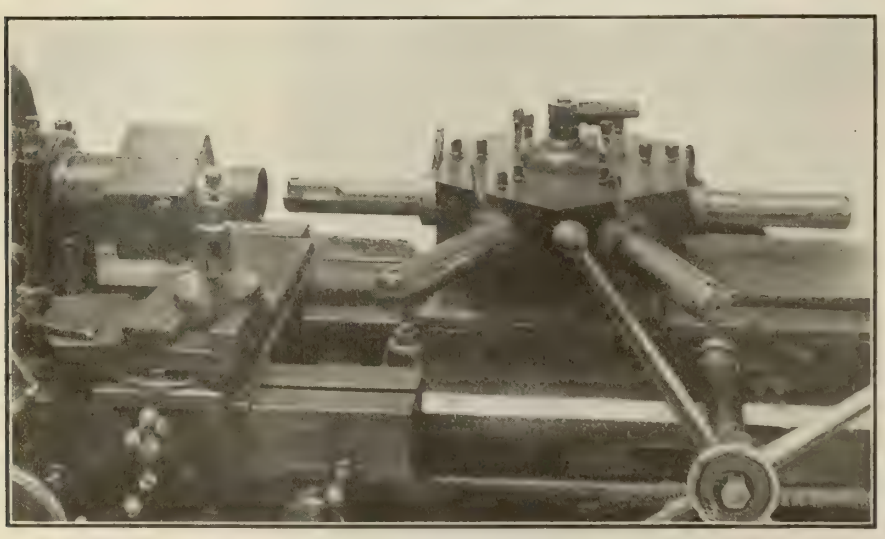
Cutting the groove and wave for the copper rifling band is done in the 7th operation. An ordinary engine lathe fitted with a special fixture for carrying the grooving, waving and under-cutting tools is used for this. It might be here stated that the purpose of the waving is to prevent the copper band from moving round when the shell is being fired. One end of the shell forging is held in a chuck which has on its face a cam, while the other end is supported by a revolving centre, cup-shaped to fit the end of the shell. It will be noticed in the illustration that the cam brackets are bolted to the saddle and

the tool holders to the lathe bed. The grooving and waving tool is held in the front holder and the two undercutting tools, left and right hand



OUTSIDE BODY TURNING AND FINISHING BASE.

are held in the back holder. At the beginning of the operation, the saddle moves towards the headstock and causes the cam on the brackets to force in gradually both the front and back tool holders. The movement takes care of the feed. The front holder containing the grooving and waving cutter is held up against the cam on chuck by the spring on the right. The cam imparts an oscillating motion and gives a wave to the ribs. At the same time, the back tool holders containing the undercutting tools are being forced in by the two cams



OUTSIDE NOSE TURNING, BORING DIAPHRAGM AND POWDER CUP SEATS, AND FACING TO LENGTH.

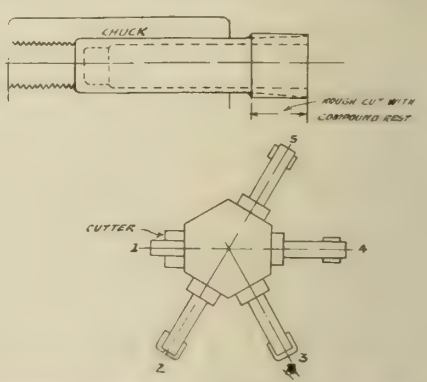
in a diagonal direction which is obtained by the holders running on diagonal guides on the slide. A stop in the centre of the fixture regulates the depth of cut for all the tools. The capacity of the machine for this operation is ten per hour. This is the last operation previous to the heat treating.

### Heat Treating.

The next operation is perhaps the most important of all as the shell must have a certain degree of hardness within a small range before being accepted by the government. The tensile strength of the shell after heat treatment must be approximately 80,000 pounds per square inch, with a small allowance above that figure. It follows that great care must be exercised during this operation to obtain satisfactory results. The shells are first placed in a muffle gas furnace at a temperature of 1,560 degrees F. for about 20 minutes, and are then quenched in an oil bath. This process hardens the shell. The oil is cooled by air being passed through the bath. The shells are next tempered by being placed in a muffle furnace for about 12 minutes at a temperature of 830 degrees F. They are then taken out and allowed to cool gradually in the air. Each furnace is equipped with a pyrometer, and the oil tank with a thermometer.

### Scleroscope Test.

The shells now undergo the scleroscope test for hardness which must be around 45, a slight variation above or below being allowed. A narrow strip round the body of the shell is first polished, after which it is taken to the scleroscope. This apparatus consists of a vertical glass tube with an arrangement at the top for drawing up the steel hammer in the tube and a catch for holding the hammer until released. This part of the apparatus is operated by a rubber air bulb. At the back of the tube is a scale on which are figures which bear relation to the tensile strength of certain metals. The shell is placed in a grooved block under the scleroscope and the diamond pointed steel hammer allowed to drop on the polished part of shell. The hammer rebounds and the figure at which it stops is noted by the operator. This is repeated several times, the shell being moved round each time.



BORING DIAPHRAGM AND POWDER POCKET SEATS AND FACING TO LENGTH.

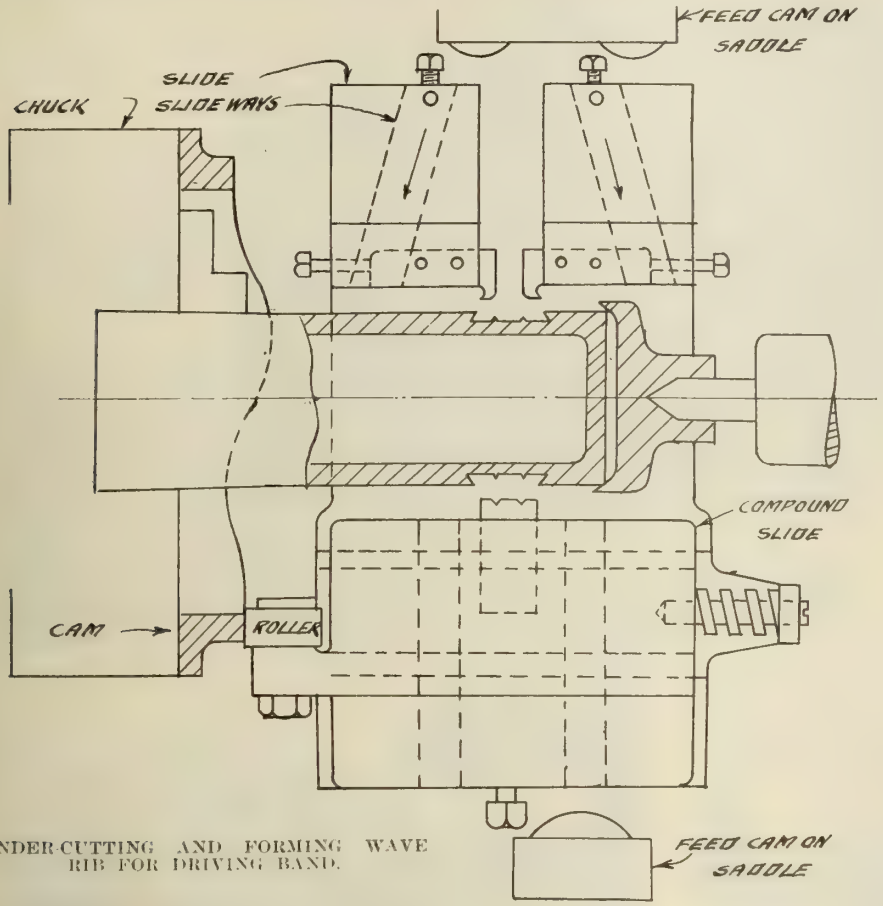
### Preparing Test Piece.

The 9th operation consists of making up the shells in tested batches of series of 120, one being taken out to have sections cut for the tensile test by a government inspector. The rest of the batch are held up until the inspector's report is received, unless unduly delayed. Three test pieces are prepared and to obtain these, part of the shell is milled flat and the test pieces cut out and worked up to a certain sectional area.

### Nosing Operation.

Up to this stage the shell is practically straight, and, before any more machining can be done, the open end must be partially closed up. This operation, which is the 10th is called nosing or heading. The open end of the shell, for about three or four inches, is held in a

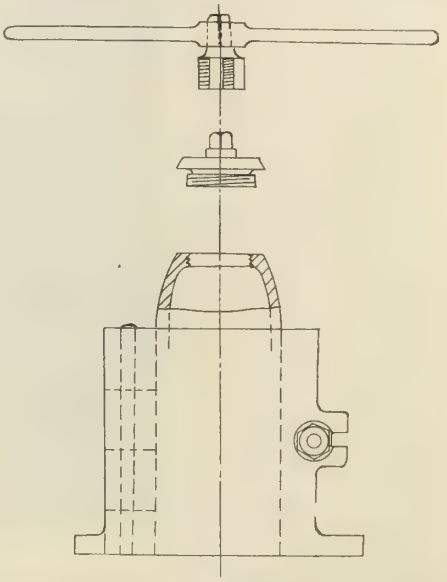
bath of molten lead until sufficiently heated. The diaphragm which is larger in diameter than the nose is then dropped in and the shell placed nose up in a press, after which a cone-shaped die descends and closes in the nose to the required shape and size. The shell is next taken out and the nose dipped in powdered lime which has the effect of softening the metal. In the foregoing forty shells per hour can be treated.



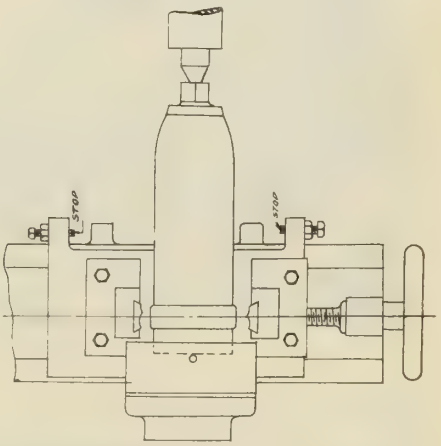
UNDER-CUTTING AND FORMING WAVE RIB FOR DRIVING BAND.

### Turning and Threading Nose.

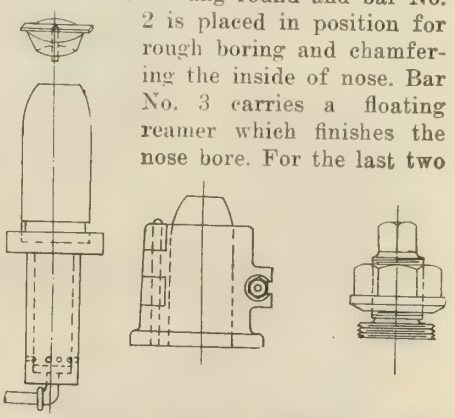
The shell is now ready for the 11th operation which consists of turning and threading the nose. This is performed on an engine lathe with a turret on saddle slide in place of the ordinary tool holder. The turret is moved round by hand and locked by lever shown in front. The shell is held in a box chuck and is first faced to length by cutter on bar No. 1, a swinging saddle stop being used. The turret is then swung round and bar No. 2 is placed in position for rough boring and chamfering the inside of nose. Bar No. 3 carries a floating reamer which finishes the nose bore. For the last two tooling operations, a stop on the slide regulates the travel of saddle. The in-



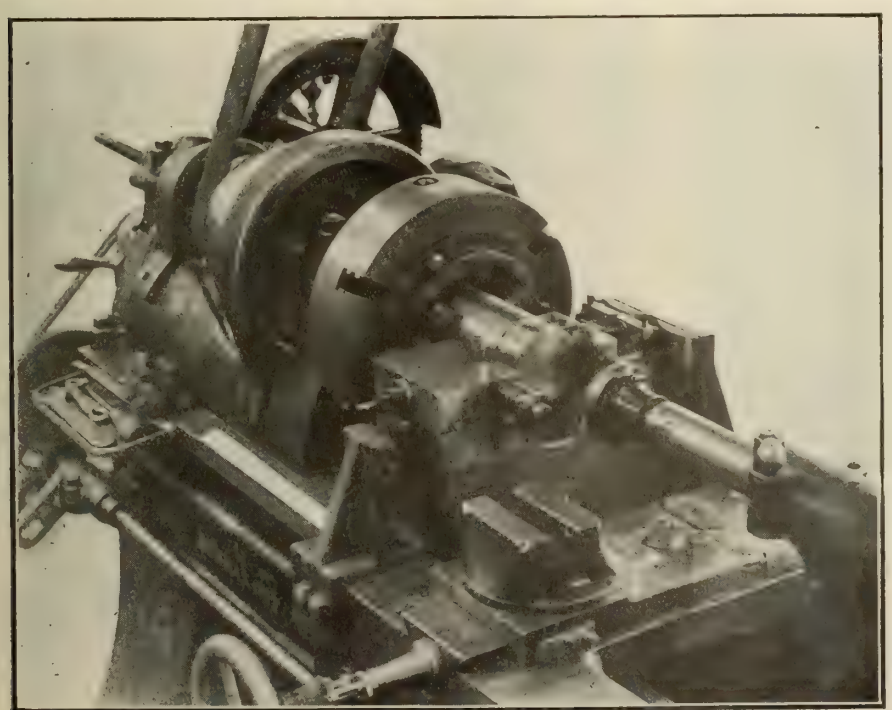
HAND TAPPING AND SCREWING THREADED CENTRES IN NOSE AND REMOVING CENTRES.



COPPER DRIVING BAND TURNING.

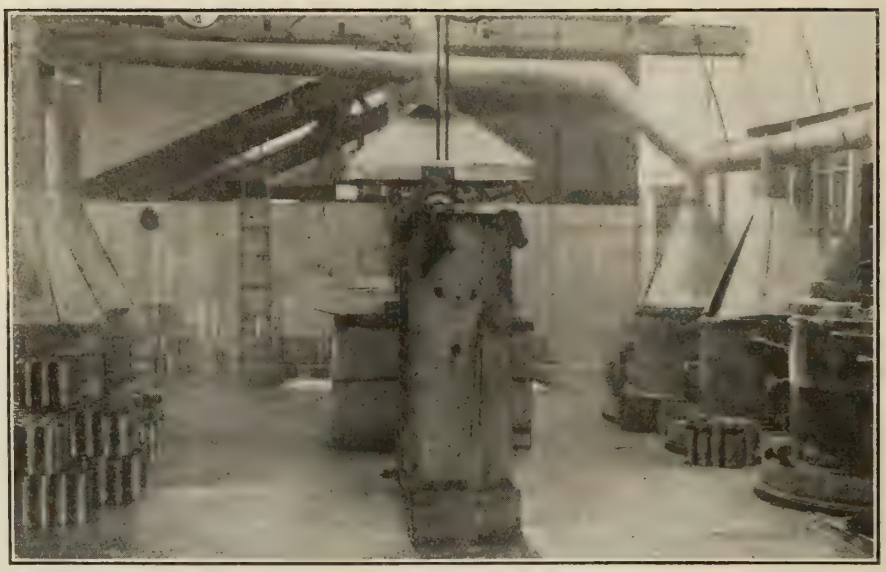


ASSEMBLING—SPECIAL FUNNEL TO KEEP TUBE CENTRAL, AIR VIBRATOR, HINGED CHUCK, BRASS SOCKET AND THREADED PLUG.



DRIVING BAND GROOVING, UNDER CUTTING AND FORMING WAVE RIBS.

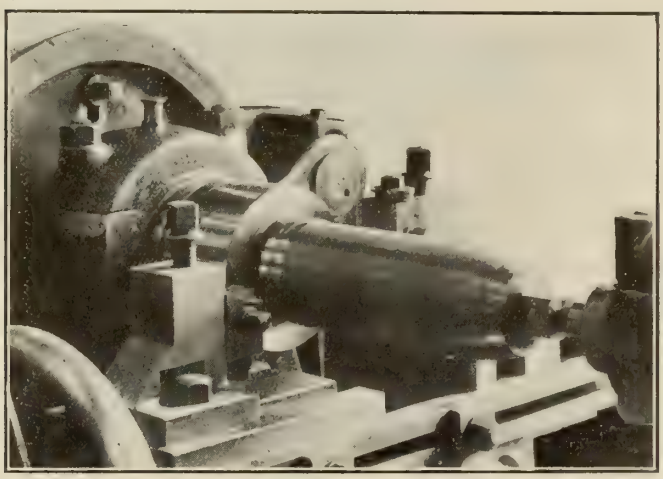
side of nose is next bored by cutter on bar No. 4. To obtain the correct outline, a cam is fixed to a bracket secured to the bed between the slides, and projecting from the base of turret is a bracket carrying a roller. When the cutter is in operation, the roller follows the face No. 1 of the cam and imparts the outline to the cutter. Bar No. 5 taps the bore and No. 6 rough turns the outside of the nose; in this case, face No. 2 of cam gives the outline. The saddle during the entire operation is operated by hand. The lathe capacity for this operation is seven per hour.



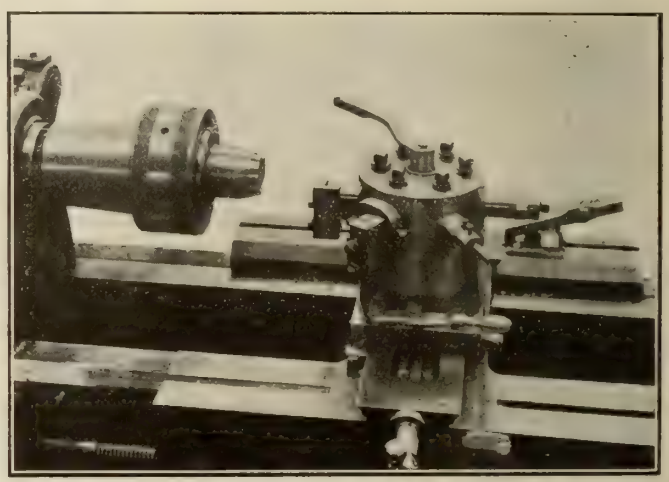
HEAT TREATING HEATING FOR HEADING.

**Fitting Threaded Centre and Rough Turning Body.**

This last operation completes the machining of the inside of shell, but the outside has yet to be finished. In the 12th operation the shell is held in a hinged chuck and the threaded part of nose is hand-tapped. A

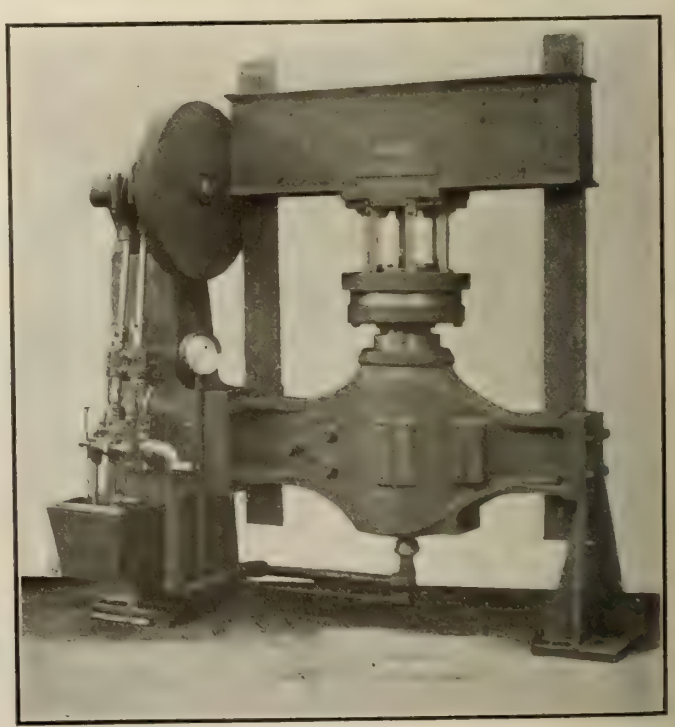


COPPER DRIVING BAND TURNING.



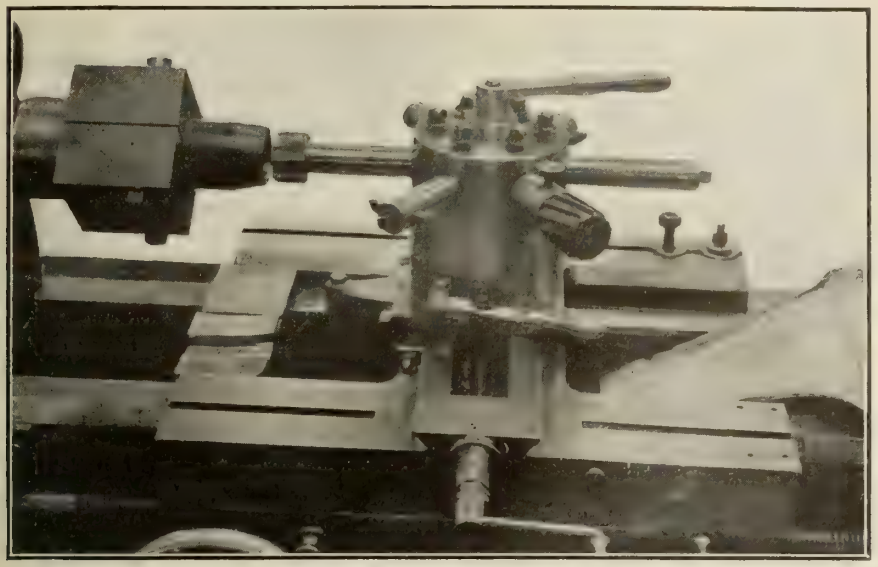
SOCKET FINISHING.

TESTING SHELLS FOR HARDNESS.



PRESSING ON DRIVING BAND.

threaded centre is then screwed in the nose for holding it in the lathe at the next operation. At the 13th operation, which is performed on an engine lathe, the shell is held in a collet chuck and

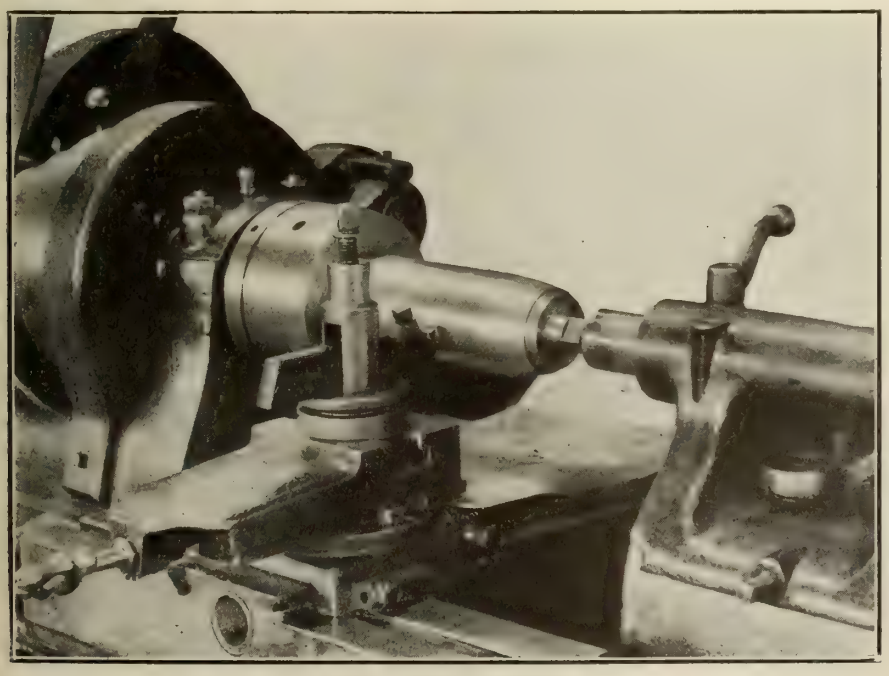


HEAD TURNING AND THREADING.

rough-turned from the copper band recess to the curve on the nose.

### Finishing Cut on Body.

In the 14th operation, the finishing cut is made from the band recess to end of nose. This is performed on an engine lathe equipped with a special cam fixture for giving the correct direction for the travel of the tool. In addition to the curve of the nose, the increased diameter of the shell at the shoulder has to be taken care of, the shell being of larger diameter at the shoulder than on the body. The cam is situated at the back of lathe above the bed, and at the back of and attached to the slide is a bracket which extends over the cam and has a roller attached which engages with the cam. Two springs held the roller against the cam and give the required direction to the tool through the slide. In this operation one man can handle two machines with an output of eight per hour.



ROUGH BODY FINISHING.

### Inspection and Marking.

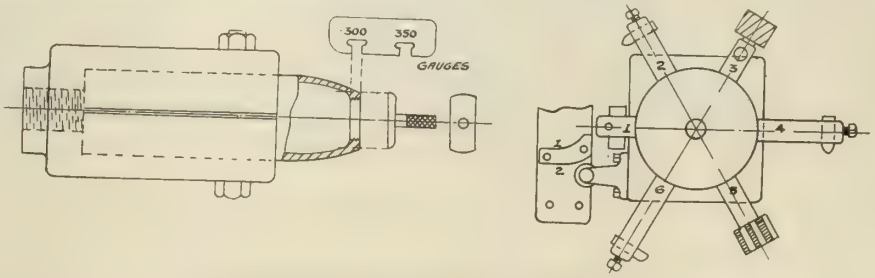
The next three operations consist of removing any scale that may be on the inside of shell, washing the shell in boiling caustic soda to remove grease and dirt, and finally government inspection. The shells are very carefully inspected and weighed, high and low limit gauges being used. They are afterwards taken to the marking machine, but, before being put into same, wedges are inserted in the shell to prevent any possibility of its being distorted by the pressure of the die.

### Pressing on Rifling Band.

The next operation consists of pressing on the rifling band in the groove prepared for it. This is done on a vertical hydraulic press fitted with a special attachment holding six wedges. The press is capable of exerting a pressure of 25 tons. The copper ring is slipped on the shell and put in position, the shell being then placed in the press nose end up, and the pressure applied at six points through the wedges. The copper band is now secure and ready for turning up.

### Turning Rifling Band.

For turning the copper rifling band, an engine lathe is used. The shell is



SHELL HEAD TURNING AND THREADING.

held in a short collett chuck and is supported at the tail stock end by a threaded centre. On the cross slide are two tool holders with cutters of suitable shape. A roughing cut is first made with the back tool and a finishing cut with the front tool. A stop on the slide is adjusted to the correct diameter for the band. The output for this operation is fifteen per hour.

### Assembling and Filling Shells.

The shells are now ready for assembling and filling which is the 21st operation. The tin powder cup is first slipped in past the diaphragm into the powder pocket and the brass fuse tube screwed into the diaphragm. The shell is then taken to an air-jarring machine and filled by a special funnel with bullets which have been previously weighed. The jarring helps the bullets to pack close together. Hot resin is then poured in and a brass socket screwed in the nose of shell by means of a threaded plug, the shell during the latter process being held in a hinged chuck. The shell is weighed after the bullets and also after the resin

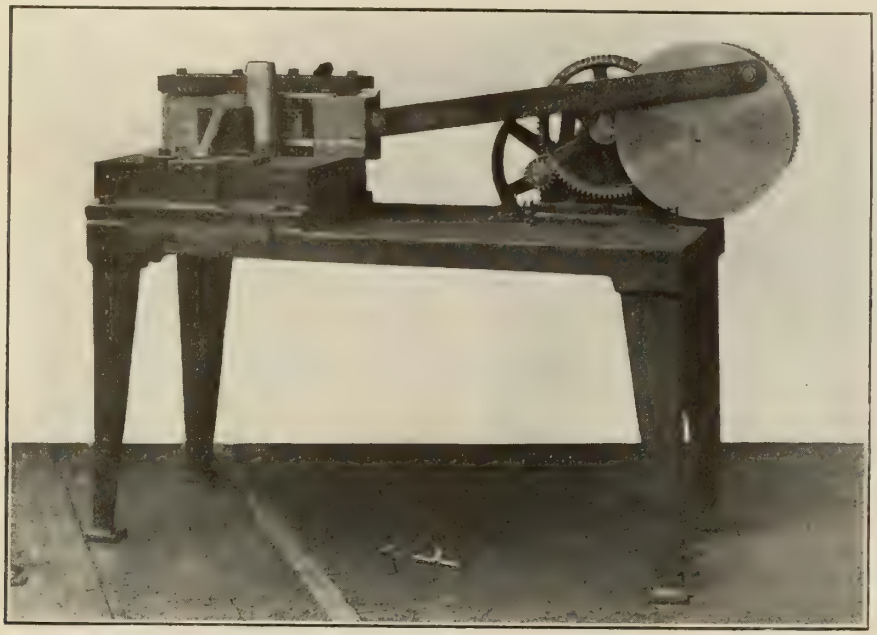
has been put in and the necessary adjustment made.

**Socket Finishing.**

In the 22nd operation, the brass tube is soldered to the socket. The next operation consists of finishing the socket, this being performed on an engine lathe with turret attachment, with the shell held in a special chuck. The fuse tube is first cut off and the inside of socket cleaned up. The end of socket is then finished off and the outside of socket turned to conform to the radius of shell nose. This completes all machining operations.

**Final Weighing and Painting.**

The brass socket is now hand tapped to gauge and the brass plug screwed into it. The shell is then cleaned and finally weighed. The weight must be very accurate, not exceeding four drams either way. After being inspected by a government inspector and stamped, the shell is given two coats of grey paint on the body, the nose end being painted a bright red. Shipment is made in special boxes holding six shells each.



BERTRAM SHELL MARKING MACHINE.

## SHRAPNEL SHELL CARTRIRGE CASES.

THE development of a shrapnel shell represents a vast amount of experimenting and study, but the shell itself is not comparable with the wonderful processes and tools which are employed in its manufacture. The interesting phases of shrapnel manufacture are the formation of the brass case, the forging of the steel shell and the finishing of the various shell and fuse parts to the degree of accuracy required. The production of a brass case 11½ inches long, 3 3-5 inches diameter (the British 18-pounder) requires 17 different operations.

It is formed from a flat circular blank 6¼ inches in diameter and ⅜ of an inch thick. This is first drawn into a shallow cup shape, and is then gradually elongated by being forced through steel dies which are progressively smaller in diameter. These drawing operations are so controlled that only the sides of the case are made thinner, the bottom retaining practically the original thickness to insure the necessary strength. After a smooth seamless case is drawn by the method referred to, the bottom is turned true and a central hole bored out and threaded to receive the primer or cap for exploding the propelling charge. As these brass cases, as well as those for other kinds of ammunition, contain about 65 per cent. of copper, the importance of this metal in modern warfare is apparent. This explains why the cost of copper has increased over 200 per cent. in Germany since the beginning of the war.

The framing of battleships is usually on the longitudinal system, the transverse framing being worked intercostally.

Every day at 5 p.m. in war time, the whole of the fighting mechanism of a British warship is tested and got ready for the night.

ASSEMBLING POWDER CUP, FUSE TUBE, BULLETS, SOCKET AND RESIN.

# Shell Production in a Locomotive Engineering Works

Staff Article.

*The equipment of our up-to-date locomotive building establishments compares perhaps more than favorably with most mechanical engineering institutions in their adaptability and general readiness to extend the scope of their operations, hence small wonder is it that the illustrations and description which follow will be found to show that as regards shrapnel shell production, this chosen plant is well to the front in its every feature requirement.*

A CONSIDERABLE proportion of metal working plants in Canada have undertaken the manufacture of shrapnel shells by means of specially manufactured machines and tools. Of course, for some of the simpler operations, standard machines have also been employed to advantage. Many other firms, however, have either found it impossible to purchase machine tools for this particular work, or have deemed it the wiser plan, in view of the uncertain length of the time that the demand for shells would continue, to tool up their standard machines and use them wholly to the best possible advantage. Among the latter is the Locomotive Company, whose shell department this article features.

In a locomotive shop the product cannot be termed standardized. This is quite easily understood, because it is not often that the same type of locomotive is specified on repeat orders. The continued demand for more tractive power and higher efficiencies have caused the design of a locomotive to be continually changed. Thus, usually an engine has to be laid-out on the drafting boards, from the drivers upward, to boiler, superheater, fire box, valve gear, cylinders and frame. Thus the men employed in the manufacture of locomotives are wide awake men and keenly alive to many practices and principles of which the average shop man, with a more or less standardized product, is blissfully ignorant.

This firm, when it decided to tool up its standard machines or special machines used in locomotive work, knew well that its engineering department was able to do this to better advantage than most shops. Thus, on visiting the shop to-day with all the machines engaged on their various operations and noticing how perfectly the tools perform and the speed with which the work is accomplished, one cannot but feel that the superintendant who designed and super-

vised the outfit is deserving of the greatest praise.

Several new machine tools, including two flat turret lathes and several small engine lathes, have been purchased and are being used in the shell department. These purchases had been contemplated, however, before the question of shell manufacture had been taken up, as a new machine shop had been erected and new tools were to be purchased for installation. It may, therefore, be said that the only equipment purchased by this company expressly for the manufacture of shrapnel shells was the collapsible tap used in finishing the inside of the nose. In performing several operations, these shop-made tools have established some remarkable time records which have, we believe, yet to be challenged.

The shop is divided into two departments which are shown in Figs. 18 and 19, and give a good idea as to the course of the shell in process of manufacture.

**Marking of Forgings, Etc.**

The point of reference from which all preliminary measurements are taken for the first roughing cuts on a shrapnel shell, seems to be the bottom of the powder pocket of the forging, which is, of course, the logical place from which to take these measurements. The shell is placed over the fixture A in Fig. 20. This fixture is made of machinery steel and stands upon a plate, the surface of which has been finished. The top of this steel fixture comes in contact with the bottom of the powder pocket, while the increased diameter of the lower portion of the fixture, being only slightly smaller than the inside of the forging, guides it, and keeps it vertical. The hollow steel sleeve B is then slid over the forging, this steel sleeve being only slightly larger than the latter in its inside diameter. The top and bottom edges of this sleeve are finished, as also is the slot shown. The line to which the back end of the shell is to be rough faced is marked in chalk from the top edge of the sleeve, and the line at which the open end of the shell is to cut off is marked from the lower edge of the slot. The shell is now removed to the cutting-off machine,

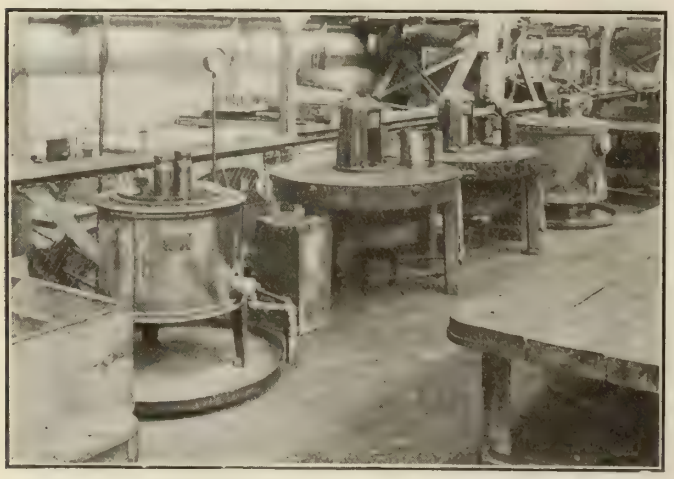

FIG. 8. CANADIAN-HOSKINS AND CHICAGO FLEXIBLE SHAFT CO. LEAD POTS AND NOSING PRESSES.

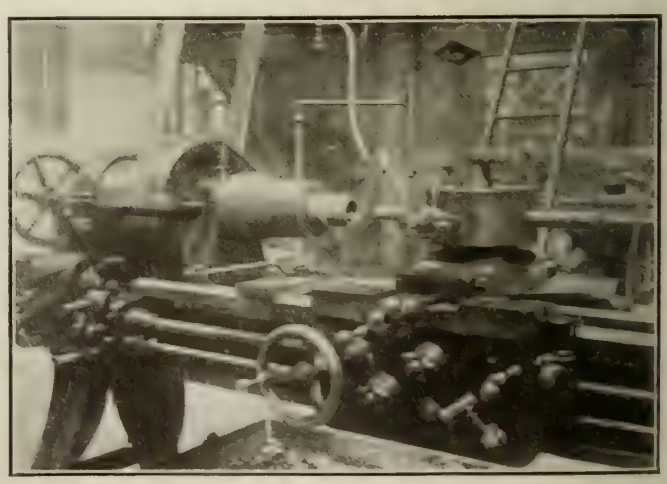

FIG. 9. AMERICAN LATHE WITH TURRET FOR FINISHING INSIDE OF NOSE, 18-POUNDER SHELL.

the chalk lines being clearly centre-punched.

Fig. 1 shows a Potter & Johnston machine equipped with a Skinner universal chuck. A single parting tool is used to cut off the ragged end, and approaches the work from the far side. This operation is also carried out in a similar manner on a Bertram cutting-off machine and also on a Herbert (Coventry, Eng.) heavy duty turret lathe having a universal chuck which forms a part of the regular equipment of the lathe. On these machines the tools approach the work from the near side of the machine. The number of shells marked off by one man in a day of 11½ hours is 808, and the number of shells that one man on one cutting-off machine has handled in an 11½-hour shift is 285. Water lubricant is used on the tools.

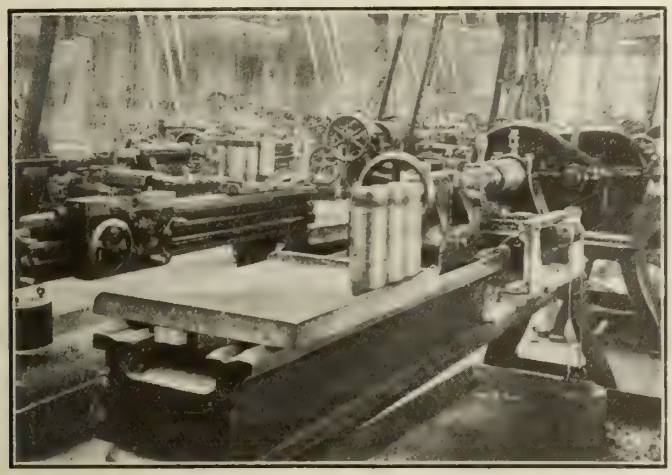

FIG. 10. C.M.C. ENGINE LATHE AND AMERICAN ENGINE LATHE FITTED FOR FINISH TURNING SHELLS.

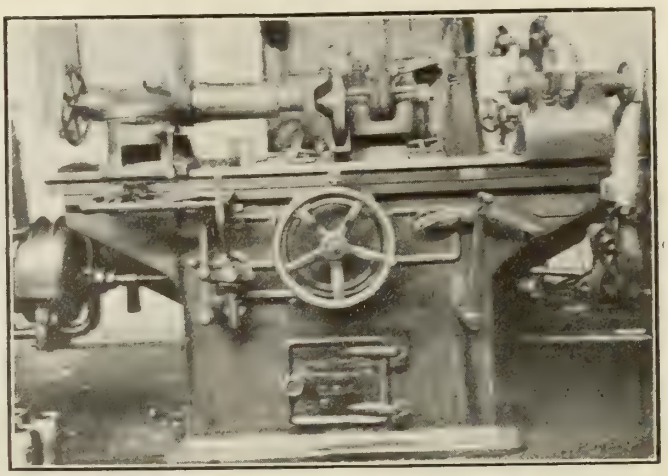

FIG. 11. LANDIS GRINDER FOR FINISHING AND CLEANING UP BASE OF SHELLS.

### Cutting Off the Back Ends.

In this operation an instance of how some of the large machine tools used in locomotive work have been pressed into service is shown. Fig. 2 shows a large Newton rod miller to which has been fitted two special jigs to which the shells are clamped after the ragged ends have been cut off. The shells are staggered in the jigs, as can be seen. One clamp or strap, the inside of which has been formed to fit the curves of shells, serves to hold two shells. One hundred and sixteen shells can be clamped in the two jigs at once in four rows of 29 each. Two milling tools are used ,each having a 10-inch face. The diameter of the cutters is 8 inches. The teeth are inserted and thus it is a simple problem to keep the machine supplied with tools to ensure its operating continuously if required.

The jigs or clamping blocks are made of cast iron. The cutting can be made practically continuous because, as the finished shells pass under the head, they are removed and new ones placed in the jigs, while the machine is still in operation. Thus, when the table arrives at the end of its travel, the tools are raised a little from the work, and the table is quickly run back to commence another cutting stroke, and shells are already clamped in the jigs to receive the milling cutters. This machine has milled 796 shells in 11½ hours. Another machine that has been fitted up to face of the back ends of the shells is a 60-inch vertical Bertram boring mill. A circular cast iron clamping block is bolted to the table of the machine and the ends of the shells are faced. However, the Newton rod miller is capable of machining all the shells required at present and the boring mill has been used rather as a stand-by for machining small lots.

### Rough Turning Operations.

The rough turning is done mostly on hollow spindle engine lathes. There are five Whitcomb engine lathes and one Canada Machinery Corporation engine lathe used in this work. The shell is held in a special expanding chuck made in the shop. This chuck is shown in Fig. 21. The milled jaws on the outer end of the shell act as a stop and locator. There are three expanding jaws in the inner end which are forced out by the taper on the central rod. This rod passes through the hollow spindle of the lathe and a handwheel is keyed to the end of it. This handwheel is used to open and close the jaws.

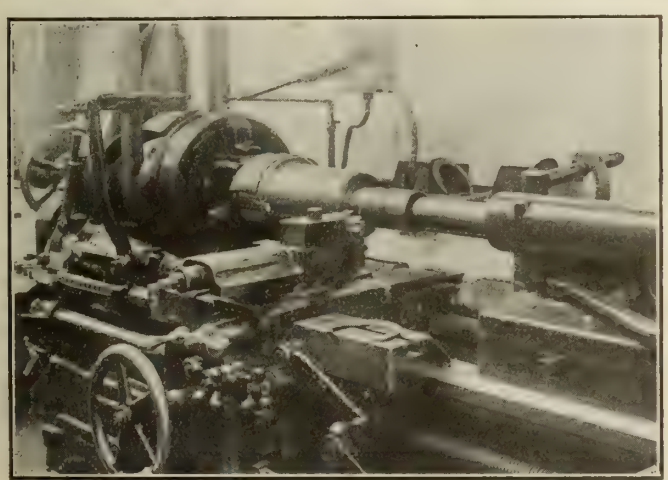

FIG. 12. C.M.C. ENGINE LATHE WITH SPECIAL COLLET CHUCK TURNING COPPER BANDS.

FIG. 14. GENERAL VIEW OF THE ASSEMBLING DEPARTMENT.

A groove is turned in the outside of the jaws in which a circular ring of spring steel is placed. The ring is split and is expanded when the jaws open. When the tapered shank of the rod is withdrawn this spring is sufficiently strong to cause the jaws to draw away from the work and keep pressing against the tapered shank.

The lathes are all fitted with turret tool posts as will be seen in Fig. 3. These tool posts are placed on the far side of the carriage. The first tool rough turns the body of the shell up to about two inches of the open end. Then the tool is re-set, taking a lighter cut and just truing up end of the shell. The shoulder is next removed and a rough taper formed by the hand manipulation of the cross slide. This is all done with one tool. The tool post is now swung around a quarter of a turn, a finish turning tool is placed in position, and the shell is finish turned up about two inches from the back end. The tool post is swung around another quarter turn and the tool for facing the end of the shell brought into position. After the end of the shell has been faced, the turret is again swung a quarter of a turn and a radius of 1-10 of an inch is formed on the corner of the shell. This completes the series of operations on these rough turning lathes. Snap gauges are provided the operators to caliper their work. A little gauge is also used to test the profile of the radius on the end of the shell. Soda water cutting lubricant is used on all machines engaged in rough turning.

The average production of one man on one machine is 90 shells in one shift of 11½ hours, which is remarkably good work.

### Cutting Recess and Forming Wave Lines.

Four lathes are fitted up with tools to accomplish this work, namely, a Lodge & Shipley engine lathe and three Canada Machinery Corporation engine lathes. A fifth engine lathe, a London Machine Tool Co. product, is also equipped to do this work, but is not in use constantly on this operation. Fig. 4 shows the Canada Machinery Corporation lathe with a shell ready to have the recess cut. To the face plate of the lathe is clamped a steel three-point cam, as illustrated in Fig. 22. The shell is placed in the central casting against a stop, and it is securely held there and driven by the tightening of the set screws. The other end of the shell is supported by a revolving centre mounted on the tail stock spindle of the machine. Throughout this entire operation the carriage is locked to the ways of the lathe.

FIG. 13. RESIN POT WITH WOODEN HOPPER ABOVE FOR SHOT.

On the far side of the cross slide is bolted a tool holder, which carries a tool that when fed into the work cuts the groove roughly to its width. The cutting edge of the tool is flat, and this tool cuts the groove till the bottom diameter is 1-64 of an inch greater than the finish diameter over the wave lines. The tool is then withdrawn. On the near side of the cross slide, a turret tool holder is bolted; this carries the undercutting tools and the wave-forming tool. Fig. 23 shows this turret tool holder in detail. A lever on the squared end of the cam, shaft A, is used to actuate the cam, by means of which the undercutting tools are fed into the work. These two tools cut the recess to its finish width, and they also cut the groove at its edges to its finished depth. The cam is so designed that the tools have cut to the finish depth and width just as the highest point of the cam is reached. The guides of the little tools are arranged at an angle to the work and, being fed into the work at this angle, they accomplish the undercutting. The guides are, of course, also so arranged that the exact finished width of the recess is cut also. A special spring of flat steel causes the tools to withdraw from the work when the lever is pulled back.

The tool post is now swung around and the cross slide is run in, until the roller C is registered against the three-point face cam. An oscillating lateral motion of the wave tool holder is thus communicated to the tool by the pressing of the roller against the face cam, but this motion is not yet wholly controlled by the cam and roller. This is due to the little stop B, which holds the little oscillating tool holder in its mid-position. The tendency of this tool holder is to move toward the head stock of the lathe, because of the flat steel spring D, and it is prevented from moving past its mid-position by the stop B; thus the roller is able to pass over to the face of the cam without difficulty, as the cross slide is fed in toward the

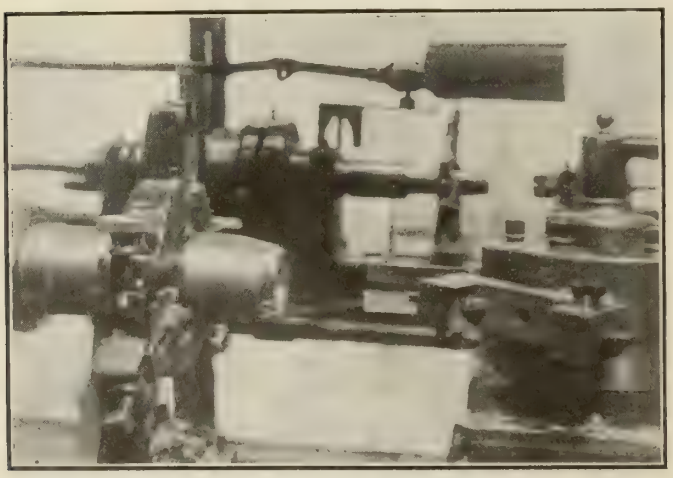

FIG. 15. WARNER & SWASEY TURRET LATHE TOOLED UP FOR FINISHING BRASS SOCKETS.

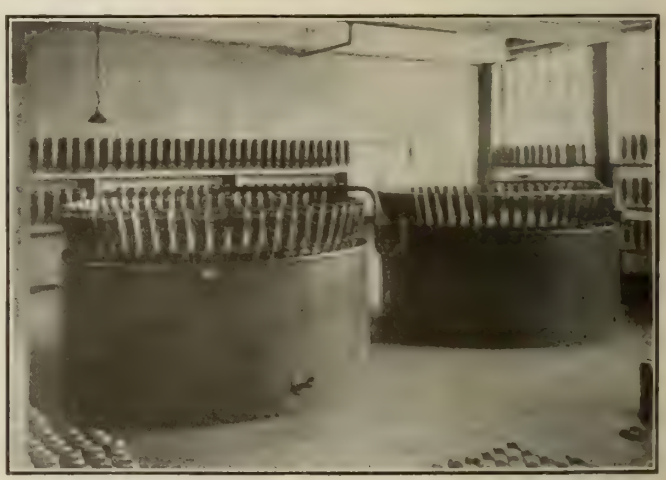

FIG. 17. TWO PAINTING MACHINES OF CANADIAN LOCOMOTIVE CO. MAKE.

centre of the carriage. The high points of the cam still touch the roller; thus the pressure against the stop B is released at certain positions of the cam, and the stop B is easily lifted out of its slot. The spring D now causes the roller to follow closely the contour of the cam, thus the tool is oscillated.

The tool is fed into the work, and the specially ground cutting edge forms the wave lines, in conjunction with the lateral motion imparted to the tool by the cam. The width of this tool is sufficiently great to clean up the bottom of the groove and when it is fed into the finished depth the recess is completed. Water lubricant is used on all machines engaged in this operation. The production of one man on one machine is 125 shells in a day of 11½ hours. Fig. 24 gives a view of the cross slide used to carry the turret tool holders.

Snap gauges are used to test the diameter of the bottom of the groove, while a little steel limit gauge is used to check up the width of the recess. This limit gauge is a piece of thin flat tool steel, one end of which is ground to the large limit, and the other end to the small limit, of the width of the groove.

### Boring Powder Pocket and Diaphragm Seat.

The boring of the powder pockets and the diaphragm seats is accomplished largely on turret lathes. There are two Acme and one Jones & Lamson flat turret lathes, all similarly tooled. One of the Acme machines is shown in Fig. 5. The shell is chucked in one of the collet chucks made in the plant. The boring bars are very rigidly clamped to the turret, one of them extending right across the turret and being supported by two clamps on the latter. Each end extension is a boring bar and carries a boring tool. The third and fourth boring bars are separate, but they pass through the single clamp on the turret, and the extensions are mortized into the larger bar extending across same. The rough boring of the diaphragm seat has been dispensed with, only a finish cutter being used. Thus only three boring tools, and hence three boring bars are being employed. Soda water is used on all cutting operations, being conveyed to the tools through ducts in the boring bars.

The first tool to be fed into the work is a gashed roughing cutter for roughing out the powder pocket. The tool is fed into the work until a stop collar on the boring bar comes against the end of the shell. The next cutter is the finish cutter for the powder socket. On this boring bar is carried a cutter which faces the end of the nose of the shell. The third cutter is the finish diaphragm cutter, which is fed into the work till a stop collar on the boring bar comes up against the nose of the shell. The shell is now taken out, all chips and any of the soda water cutting lubricant removed, and the depth between the diaphragm seat and the bottom of the powder pocket, also the thickness of the metal in the bottom of the shell are tested with tools shown in Fig. 25. The best production of one man on one machine in a day of 11½ hours is 186 shells.

Two vertical Bullard boring mills, equipped with turrets, are used for this same purpose. Fig. 6 shows one of these boring mills so equipped. A collet chuck, shown in Fig. 26, is bolted to the table of the mill. Four boring bars radiate from the turret, and are used in this operation. The first boring bar put down into the work is that carrying the cutter for rough boring the powder pocket. Unlike the tools carried in the horizontal boring bars used in the turret lathes on this work, this tool has only a single cutting edge, this type being used to increase the chip clearance room, as all chips will naturally fall, under gravity, to the point at which the tool is cutting; while in the turret lathes a steady stream of soda water through ducts in the boring bars tends to wash the chips away from the cutting edge of the tool. This single cutting edge tool is not gashed.

Previous to putting the tool down into the work, a supply of soda water is

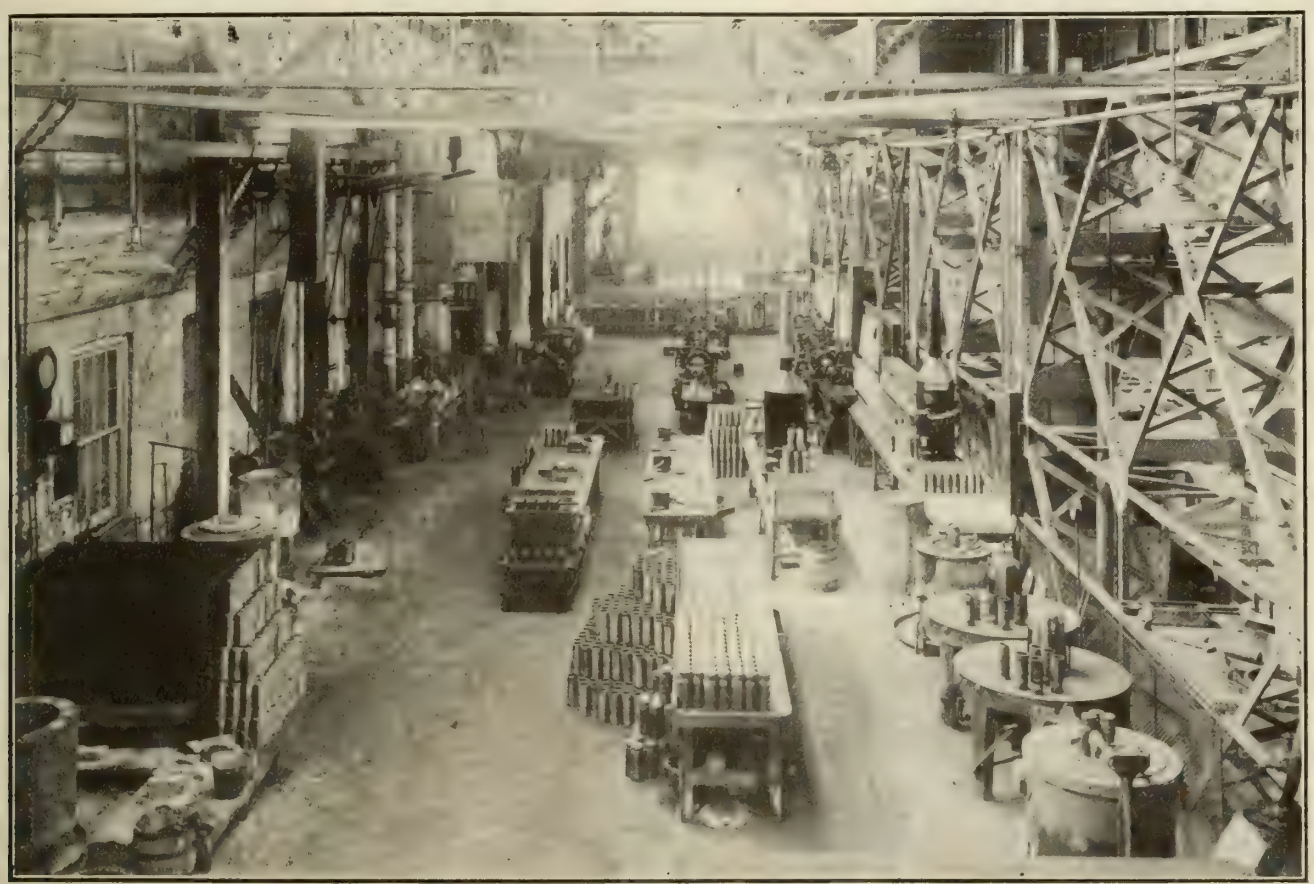

FIG. 16—GENERAL VIEW OF HEAT TREATMENT, ASSEMBLING, AND BRASS AND COPPER DEPARTMENTS.

put in the shell with a dipper or squirt gun, and a leather washer is slipped over the shell and down on to the chuck. This washer fits the shell tightly and prevents all chips from getting down into the collet slots of the chuck. A collar on the boring bar acts as a stop when this collar comes up against the nose of the shell. The tool is now withdrawn, and next the roughing diaphragm cutter is put down into the shell. This tool is taken out and a cylindrical piece of sheet metal with a blank end forming a cap is placed over the nose of the shell.

Into the blank end of this sheet metal cylinder or cap is placed a hose connected with the high pressure air lines of the shop. The air pressure is released and all chips are blown out and are deflected downwards again by the sheet metal cap and on to the table. A new supply of cutting lubricant is put in the shell and the finish cutter for the powder pocket is put down. On this boring bar a tool is also placed for facing the end of the nose of the shell, which tool acts as a stop when the finish depth of the cut has been reached. Next the finishing tool for the diaphragm seat is put down into the work. There is a stop collar on this bar which determines the proper depth to which the tool may be fed into the work. This completes the series of operations on this particular machine. The shells are also tested by the tools shown in Fig. 25. Two of these Bullard vertical boring mills are used in boring the shells, and both are similarly tooled.

**Heat Treatment and Closing-in Nose.**

From here the shells go for heat treatment. There are here two Canadian-Hoskins gas furnaces, which operate on city gas, and between these an oil tank for quenching is situated. This tank was built in the tank and tender department of the works. Whale oil is used in the tank. To each furnace an attachment is fixed, into which the exhaust flue gases of the furnace are led, and the heat used to

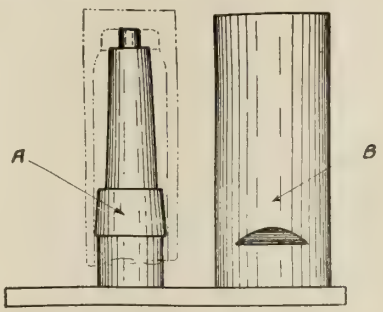

FIG. 20—MARKING SHELL TOOLS.

preheat the shells. The muffle of this preheater is of the same size as the muffle of the furnace. Fig. 7 shows one of these furnaces with the preheater attached. Twelve shells are heated in a batch, in both the preheater and the furnace proper—that is to say, that twenty-four shells are being handled at one time by the furnace. It is obvious that this arrangement not only is a time-saver, but is using fuel to good advantage.

The muffles of the furnaces are filled with a half-and-half mixture of barium and potassium, which, of course, is molten at the temperature of 1,450 to 1,500 degrees Fah. maintained in the muffle. The shells are taken from the preheater and placed, open end upwards, in the molten mixture in the muffles of the furnace. When the twelve shells are in the muffle they are completely submerged in the liquid, and are heated very quickly to the required temperature of 1,460 degrees Fah. Also, there is an entire absence of any oxidation of the carbon in the steel in the shell. As can be noted in Fig. 7, a Bristol electric pyrometer is used in connection with the furnaces to inform the operator at all times of the temperatures existing in the muffles of his furnace. From the furnaces the shells are taken to the oil quenching tanks. The heat of the shells tends to raise the temperature of the oil higher than that desired, thus a series of coils, through which cold water is circulated, is placed in the bottom of the tanks. To assist these coils further in cooling the oil, jets of compressed air in the bottom of the tank from the high pressure lines of the company agitate the oil. After the week-end shut down during the cold winter months it was found that the oil was too cold to obtain good results; therefore, a second series of coils was placed in the tank, and through these coils steam was circulated until the temperature of the oil was in the neighborhood of 60 degrees Fah.

The shells are next placed on shelves of woven wire on the inside ends of the tank, and the oil allowed to drain from them. From here they are taken to a hot soda bath and washed. One man

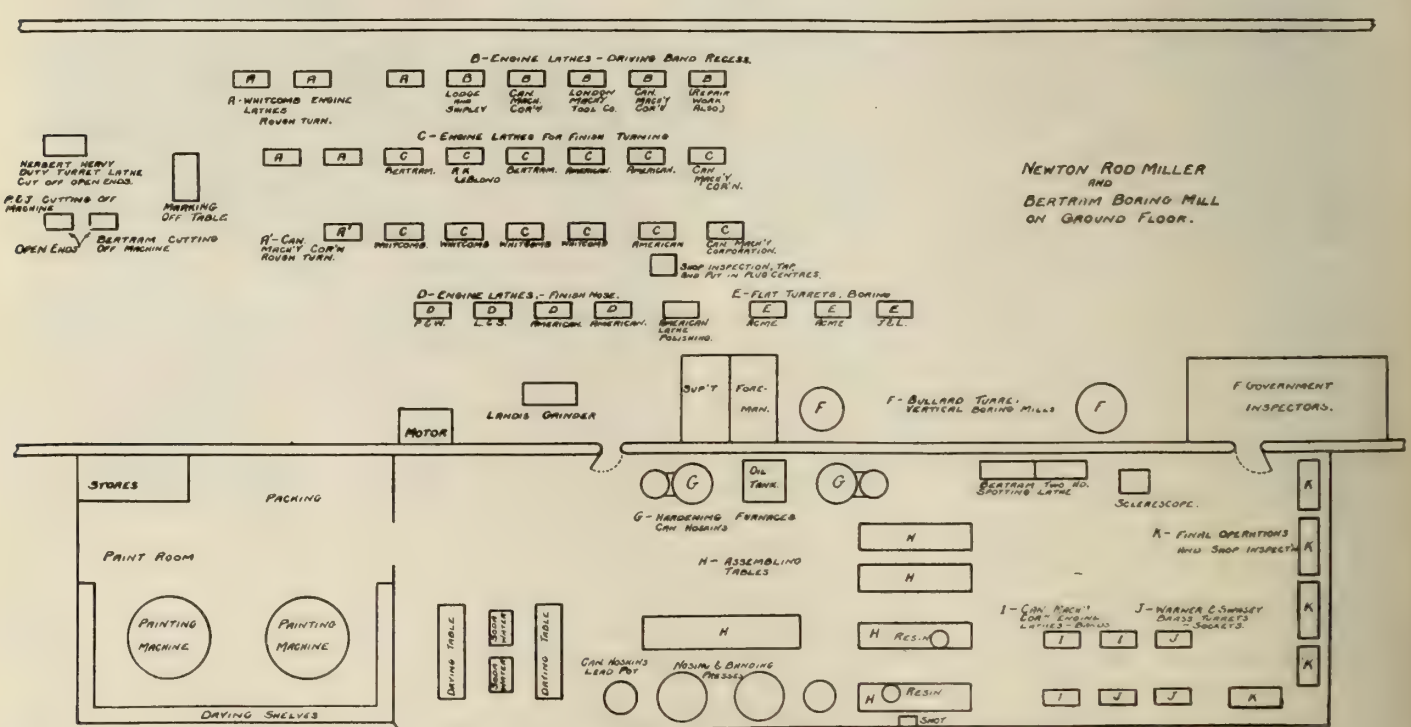

FIG. 18. TOP—LAYOUT OF STEEL WORKING SHELL SHOP. FIG. 19. BOTTOM—LAYOUT OF HEATING, TREATING AND FINISHING DEPARTMENT.

handling the two furnaces is able to harden 360 shells in a shift of 11½ hours.

From the washing operation, the shells are taken to the spotting operation. A McKechnie & Bertram lathe with two head stocks mounted on the ways is used here. Each head stock is fitted with a four-jaw chuck. The shells are roughly chucked and a ring near the recess is polished up with files and emery cloth. From here the shells proceed to have their hardness tested with a Shore scleroscope. This clean-up and hardness test department has put through 984 shells in an 11½-hour day.

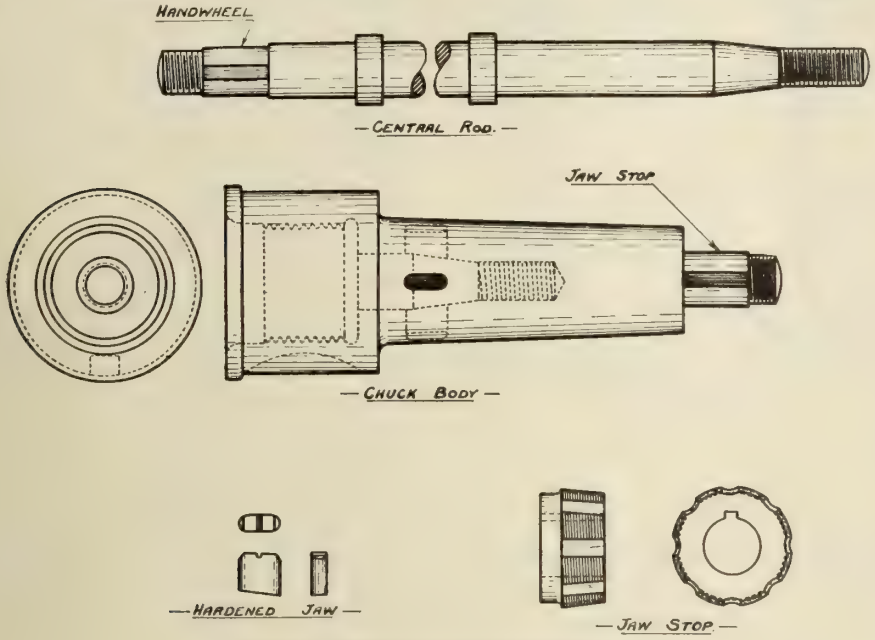

FIG. 21—DETAILS OF EXPANDING CHUCK.

The shell is next taken to the nosing press. The noses are heated to 1,400 degrees Fah., two lead pots, one a Canadian-Hoskins make and the other a product of the Chicago Flexible Shaft Co., being used to accomplish this. From out of the molten lead a rod extends, and the shell is placed over this; thus the lead is in contact with the nose of the shell, a distance which will heat it properly for the nosing press operation. On the surface of the molten lead, charcoal is placed, which prevents the lead from oxidizing or an excessive amount of heat radiating from it. Further, the lead when covered with charcoal does not seem to adhere to the nose of the shell. The shell is left immersed in the lead for one and one-half minutes, which time is indicated by a little sand-glass egg-timer. The lead pots and two nosing presses are shown in Fig. 8. Only one press is used for the 18-pdr. shell, the other being fitted up with jaws and dies for a larger shell.

After being taken from the lead pot, the diaphragm is placed in the shell and the nose is bottled on the press. The nose is again placed in the lead pot for a moment, being held in a pair of tongs by the operator. This second immersion in the lead pot heats up the nose again and tends to remove all effects of chill caused by the hot nose coming in contact with the cold steel dies. The shell is removed from the lead pot and allowed to cool slowly in the air. This department has closed-in and annealed 690 shells in a day of 11½ hours.

The body of the shell is not annealed in the usual course of events. However, should difficulties in turning arise later, it is brought back to this department and annealed. Very few shells have presented difficulties in turning.

**Finishing the Inside of the Nose.**

The shell is next taken to the lathes, where the finishing operations on the inside of the nose are completed. Four engine lathes, with turrets mounted on their carriages, are used in this operation. Two of the lathes are American machines—one a Pratt & Whitney and the fourth a Lodge & Shipley. Fig. 9 shows one of the American lathes tooled up for this operation. A collet chuck is attached to the live spindle, the details of which are shown in Fig. 27. The shell is chucked against a stop. On the turret there are four boring bars mounted.

The first tool to enter the work is shown at A in Fig. 28. This tool bores the inside of the nose. As will be seen in Fig. 9, at the back of the carriage there is a stop which swings on a pivot, and this stop when swung over and pointing toward the head stock indicates just when the turret is in the centre of the machine. The tool is thus located with regard to its central position. Immediately under the collet chuck bolted to the ways is located a cast iron stop, shown clearly in Fig. 9. The little V-shaped stop shown at C in Fig. 28 is placed on the V-ways in front of this cast iron stop, and the carriage of the lathe is fed up till it butts against this little stop. The turret has been previously located with regard to its central position, and thus the inside of the nose is bored straight. The tool is withdrawn and the inside of the nose is next rough turned and formed. The tool that accomplishes this work has a wide cutting edge ground to the contour of the shell. This tool is shown at B in Fig. 28.

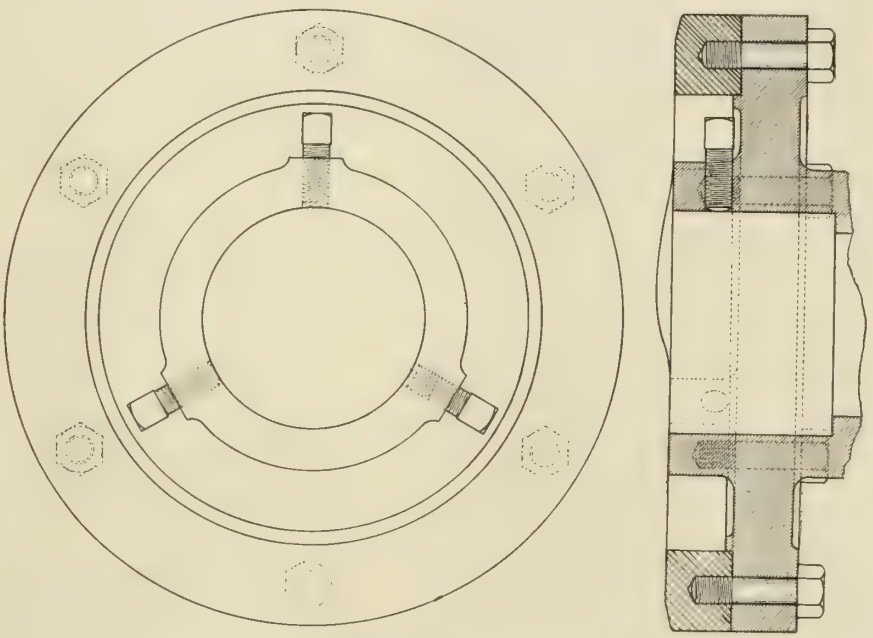

FIG. 22—THREE POINT CAM BOLTED TO SPECIAL CHUCK.

The boring bar carrying this tool is moved in through the open end of the

nose, and the carriage is run up against the cast iron stop bolted to the ways under the collet chuck. Next, a similarly shaped tool is run into the work, and this tool finish turns and forms the inside of the nose. This tool is located by the same stop as was used in the case of the roughing tool. Both tools are fed into the work against the same stop.

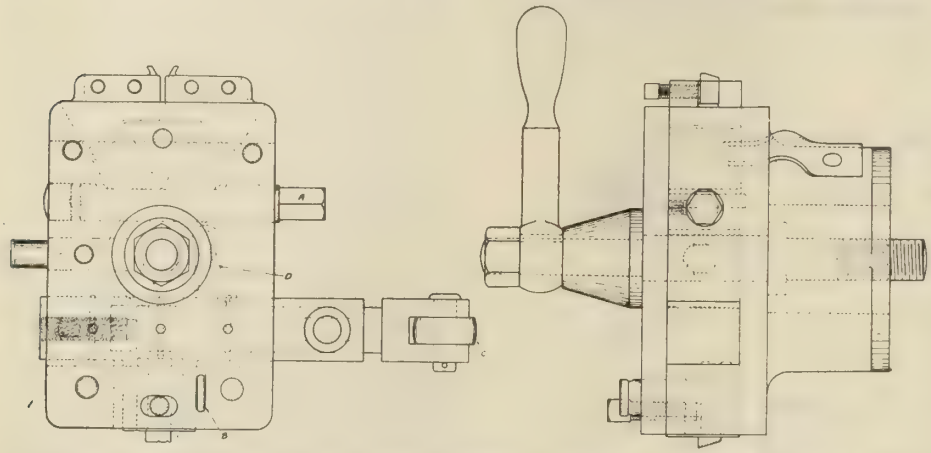

FIG. 23—TOOL HOLDER FOR TOOLS FORMING WAVED LINES AND UNDERCUTTING.

The fourth bar carries the collapsible tap, which tool is run into the nose, tapping same. The tap is mounted on the boring bar on a sleeve which allows the tap to feed freely into the work independently of the carriage. Of course, this sleeve butts against a shoulder which starts the tap into the work. Soda water cutting lubricant is used on all the operations except tapping, in which operation raw linsed oil is run over the tap. Before the firm received its collapsible taps, a straight tap was used. A back belt on the lathes enabled the tap to be backed out. No provision is made to keep the diaphragm out of the way of the boring bars, as it has been found that the bars are sufficiently large to always force the diaphragm back out of the danger zone. The production of one machine is 91 shells in an 11½-hour shift.

### Finish Turning.

The shells go from this operation to a shop inspection table, where a finish tap is also run into the nose. Next a small steel plug is screwed into the latter. This plug has an extended shank, two sides of which have been flattened, and in the end a centre is placed. This plug is shown in Fig. 29. As soon as the plug is screwed in, a small amount of a thick paste of white lead cut in oil is placed in the centre and the shell is passed on to the lathes for finish turning. The lathes for finish turning are all standard hollow spindle engine lathes with special attachments, and are so arranged, as shown in Fig. 18, that one man can operate two machines. A special collet chuck shown in Fig. 29 forms part of the equipment for each. The shells are placed in the collet chuck up against a stop, and the nose end is supported from the tail stock centre. In each lathe the cross slide feed screw has been disconnected.

Fig. 10 shows in the right foreground the rear of a Canada Machinery Corporation lathe, and in the left background the front of an American lathe equipped for this work. At the rear of the Canada Machinery Corporation machine two cast iron brackets bolted to the frame are seen, to which in turn is bolted a flat piece of machinery steel. The piece of steel has been hardened and the edge nearest the machine is ground to the exact profile of the shell. At the rear of the cross slide a fixture is bolted, which carries a hardened steel point. Two pieces of small diameter steel rope are attached to the cross slide and pass over two small sheaves on the back edge of the carriage and fasten into two eye bolts which are screwed into a heavy cylindrical cast iron weight. This weight causes the steel point carried on the fixture, bolted to the back of the cross slide, to always press firmly against the profile template of machinery steel carried on the brackets at the back of the lathe. The tool is fed into the work by means of the compound rest. The carriage is travelled by power, and the cross slide follows the exact profile of the hardened steel template.

A round-nosed tool is used in this work, and particular care is exercised to have it ground with the correct clearance. No cutting lubricant is employed, and, at the same time it is necessary to have a smooth finish on the shell. Each operator is provided with limit gauges with which to caliper his work. The tooling is giving no trouble whatever, and one man on two machines can turn out 71 shells in 11½ hours.

### Grinding Back Ends.

The shells, after leaving the finish turning lathes, have the small plug centres removed and pass on to the Landis grinder, shown in Fig. 11. Here the recess is cleaned up and the diameter at the rear of the driving band recess is also cleaned up and polished with a buffing wheel and a fine emery wheel. The back end is similarly treated. Three nicks are made with a cold chisel in the wave lines in the bottom of the groove to allow the air to escape from between the wave lines when the copper band is pressed in the groove. The shell now passes on to the preliminary Government inspection, as the final operations in the process of machining the steel shell proper have now been completed.

### Applying and Turning Copper Bands.

From the Government inspectors, the shell goes to have the copper driving bands applied. These bands are received in the form of a circular copper ring which is sufficiently large to slip over the back end of the shell. They are slipped into the recess and a blow from a hammer elongates the ring sufficiently to cause it to be retained in the recess. The shell then passes on to the pneumatic banding press shown in Figs. 8 and 30. The jaws of the press are slightly corrugated horizontally and are closed on the bands. The length of stroke of the piston is regulated by the six set-screws shown in Fig. 30. Relief valves in the piston eliminate all shock from the frame of the machine.

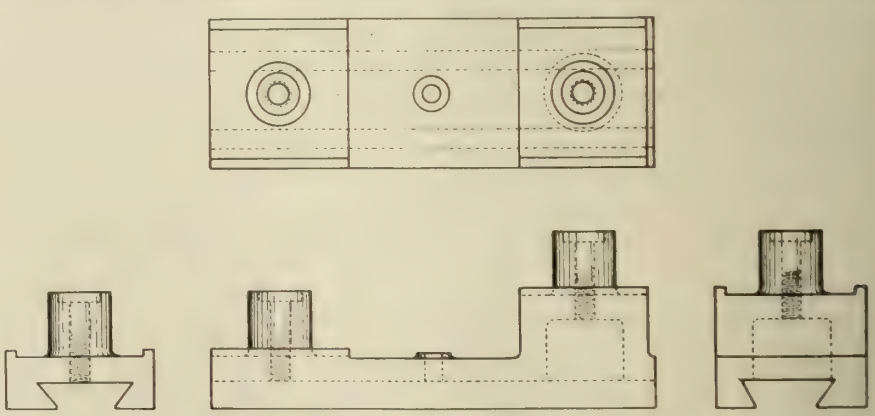

FIG. 24—CROSS SLIDE TO CARRY TURRET HEADS.

When the end of the stroke is reached, the jaws pressing the band into the groove are practically touching one another at the sides. The toggle motion transmitted to them from the pneumatic piston causes them to converge as the piston ascends, while gravity causes the piston to descend as soon as the air pressure is released from under it. This is done automatically by the relief valves, which can be set to open at the end of the adjustable stroke of the piston. After the first pressure, the shell is given a slight twist and a second pressure of the jaws is applied. Thus, a batch of forty or fifty shells is done. A small round plate of ⅛-inch steel is now placed in the machine and the shells, thus raised up ⅛ of an inch, are all given two more applications of the jaws similar to those just described.

The use of the corrugations on the jaws is here made manifest. The high points on the jaws press against the high points on the bands left there from the first two pressing applications. The result is that the band is pressed into the very corner of the undercut edges of the recess and the wave lines are imbedded into the copper perfectly. The diameter of the piston is 28 inches and the air pressure used is 100 pounds, thus four applications of the jaws press the copper bands into the grooves very firmly indeed. The press has never been employed for long periods in applying the driving bands, but in one hour it has banded 200 shells, while a batch of fifty shells was done in some ten seconds less than fourteen minutes.

Changing this press over into a nosing press is done by simply inserting the steel plug A, shown in Fig. 30. The shank of this plug is smaller in diameter than the pressed driving band, thus the toggle actuated jaws do not come in contact with the shank. The shank extends down and rests on the top of the air piston, and thus it gets its motion. The shell is placed on the plug and is moved upward and the nose comes into contact with the nosing dies placed in the fixture above.

The shell goes next to the band-turning lathes. Three Canada Machinery Corporation engine lathes are tooled up for this operation. Each lathe is equipped with a collet chuck as shown in Fig. 12. The shell is placed up against a stop and the back end is supported by a revolving centre placed on the tail-stock spindle. The tool holder shown in Fig. 31 is placed on the cross slide. The roughing tool is used to trim up the band after the carriage has been placed against its locating stop. After the roughing cut, the carriage is placed against a second locating stop and the finishing tool is fed into the work and the band turned to finish size. The cutting edge of finishing tool is ground to the correct profile as shown in Fig. 31. The operator is provided with a snap

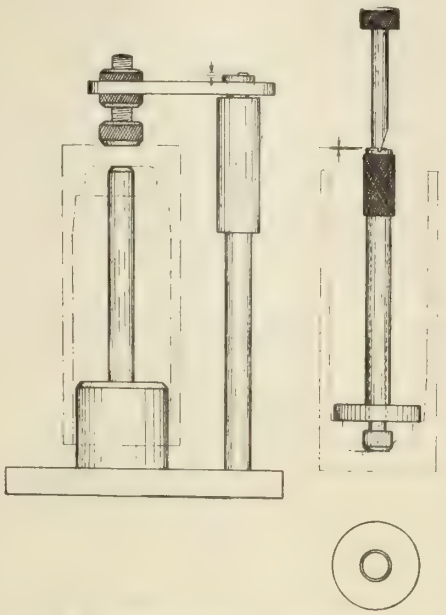

FIG. 25. GAUGES USED AFTER BORING.

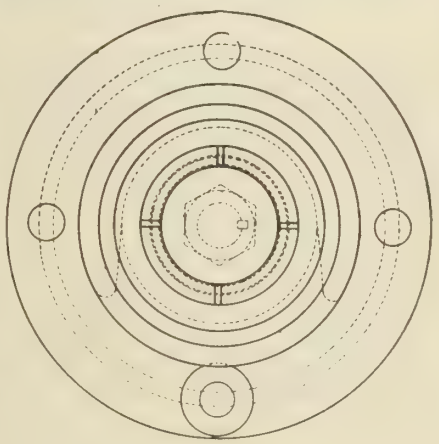
gauge to caliper the work. When the finishing tool is being used, the roughing



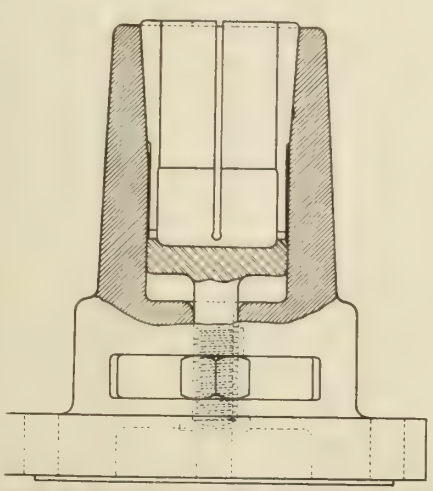


FIG. 26—SPLIT COLLET CHUCK ON BULLARD BORING MILL.

tool is swung back to clear the edge of the chuck, the method of swinging back this tool being indicated in Fig. 31. One man on a lathe tooled up as indicated above, has turned 122 copper bands in six hours.

### Assembling.

The shell is now ready to go to the assembling department, the first operation there being to put in the tin powder cup under the steel diaphragm and screw in the brass powder tube. After this has been done, a piece of pipe is placed over the brass powder tube and the steel disc is driven home to its seat with a hammer blow on the top of the iron pipe.

The shot is next put into the shell, being received from the cars and carried by an electric travelling crane to the wooden hopper shown in Fig. 13. It is run down from a feed pipe from the bottom of the hopper to the rectangular chutes surrounding the resin pot, on an incline, shown in Fig. 13, to the automatic measuring device. The pot which heats the resin being itself very warm, communicates a great deal of heat to the lead bullets in the circular chutes; thus the shot is heated. The shell is placed on the air vibrator and a charge of shot poured into it through the brass funnel to which a central rod is attached, and placed in the powder tube. This rod thus not only centres the powder tube but prevents any foreign material from passing down it. Fig. 32 shows the funnel. The air vibrator settles and closely packs the shot into the shell.

The next operation is to remove the funnel and place a little wooden plug in the top of the powder tube. Then the resin is run into the shell from one of the two resin heating pots which were made in the plant. The shell is next placed on a delicate balance and a piece or two of small buckshot added until the correct weight is attained. The brass sockets with their threads coated with red lead are now started in the noses by hand, the shell being placed in the clamp shown in Fig. 33. The steel plug, shown in Fig. 34, is screwed into the socket and securely held there with the nut N locked. The socket is thus screwed home while the resin is still hot. The little powder tube now projects through the central hole of the socket and a circular piece of wire solder is placed around it. A special shape soldering iron is used to solder the tube to the socket. Thus the assembling is accomplished. Six men working in this department are able to assemble 130 shells in 2 hours. Fig. 14 gives a view of the assembling department.

### Finishing Brass Sockets.

Three Warner & Swasey brass turning turret lathes are tooled up for this work, the shell being held in a collet chuck with outer end supported in a

steady rest. Two cutting operations only are required, the end of the powder tube being trimmed up by a flat drill ground square on the end. The second operation is accomplished with a yoked

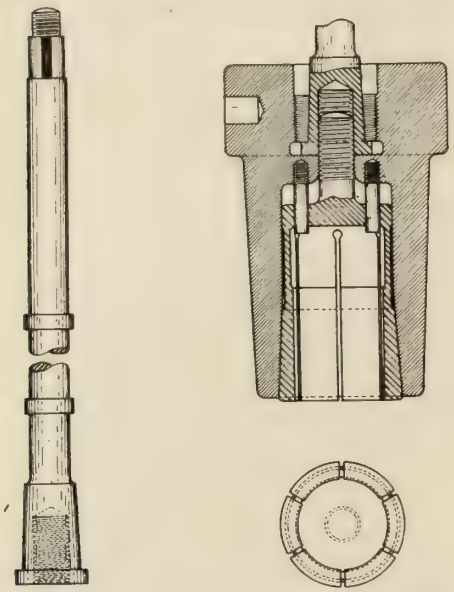

FIG. 27. COLLET CHUCK FOR FINISHING INSIDE OF NOSE.

tool holder. Fig. 15 shows the tooling of one of these Warner & Swasey turret lathes. Fig. 35 also illustrates same. The yoked tool holder contains the tools for turning and forming the outside of the brass sockets. This tool is simply fed into the work. The corner C of the little gauge shown at G in Fig. 35 is held against the shoulder formed by the tools in brass socket. Thus, when the edge F comes against the outer edge of the socket the latter is turned to the proper diameter. This tooling is excep-

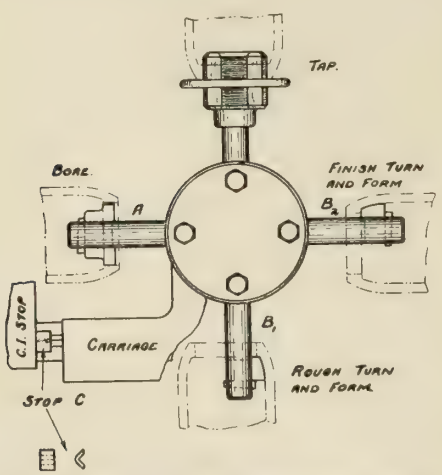

FIG. 28. TOOLS FOR FINISHING INSIDE OF NOSE.

tionally simple and some remarkable records in socket finishing have been made. Next a little reamer with a long T handle is run into the powder tube by hand to to clean out any burrs. One man has turned on one of these machines 368 sockets in 11½ hours. The shell is now taken out and inspected by a shop staff. The heat treating, assembling, finishing copper bands and sockets, and final operation departments are shown in Fig. 16.

### Final Operations.

The shell is next taken to an inspection table where a tap is run into the brass socket to clean out the thread and to have a plug screw gauge run in to test it. A small tap is also run into the grub screw hole in the socket to clean it out. Compressed air is used to blow all dirt out of the powder cup and tube. The shell is marked on a Dwight slate stamping machine, which stamps 300 shells in 6 hours. The shell afterwards proceeds to the final Government inspection.

### Painting.

From the final Government inspection the shell goes to the painting department. Two painting machines located here are really among the most interesting of any tools in the whole department. Fig. 17 shows these two machines each with their full complement of 60 shells in position. As the shells come from the final Government inspection, brass castings, shown in the details of Fig. 36, are screwed into their noses, then the shells are placed on the machine. The paint can is supported in a holder which can be moved around the outside of the machine. The painter takes his brush in hand and pushes the shell inward. This causes the bevelled friction surface of the brass casting to come against the bevelled surface of the central revolving disc. The shell is thus rotated, and the painter applies the paint with the greatest of ease. He proceeds around the entire sixty shells, pushing inward those that are stationary, causing them to revolve. He pushes his paint can ahead of him and paints the entire number in a remarkably short time. In Fig. 17 the shells are all shown in their outward stationary position.

In painting the finish coat and red leading the nose, this machine allows him to paint right to a line with the greatest ease. Steam coils are placed in the centre of the machine and the shells can be left on the machine and dried very quickly after the priming coat has been applied, the steam-coils sending a current of warm dry air up around them. The walls of the room are lined with shelves on which little spindles are placed which fit into the brass castings screwed in the sockets of the machines. Here the shells are placed to dry after the finish coat has been applied. After the shells are dry, the brass casting is unscrewed from the socket, the little brass plug screwed into the latter, and the shells packed in boxes of six each and shipped.

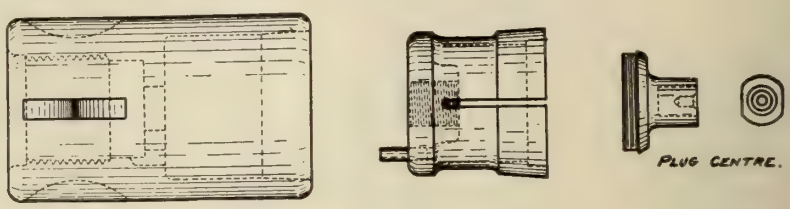

FIG. 29. COLLET CHUCK AND CENTRE FOR FINISH TURNING.

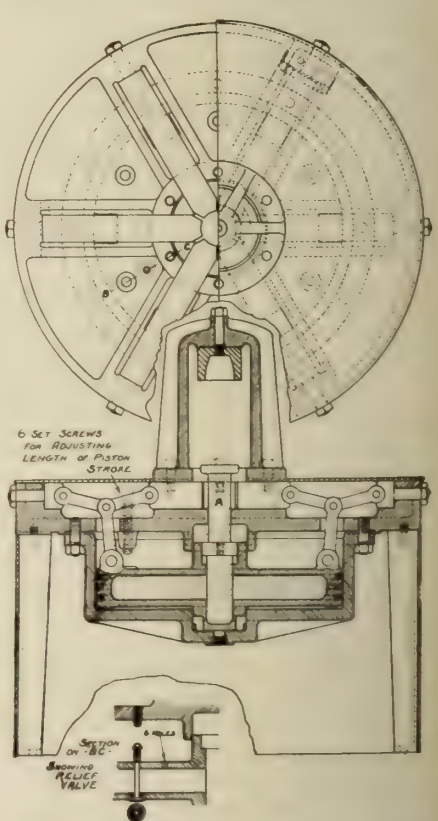

FIG. 30. NOSING AND BANDING PRESS.

One painting machine was loaded with shells which had received their priming coat and the other machine was loaded

with unpainted shells. One man applied the priming coat to the sixty unpainted shells and then applied the finishing coat to the shells on the other machine and painted the noses with red lead all in twenty-one minutes. His helper during

### General.

The shells are transported about the shop on Chapman double ball bearing elevating trucks. The platforms hold forty shells each. The entire shell shop is on the second floor of the building and

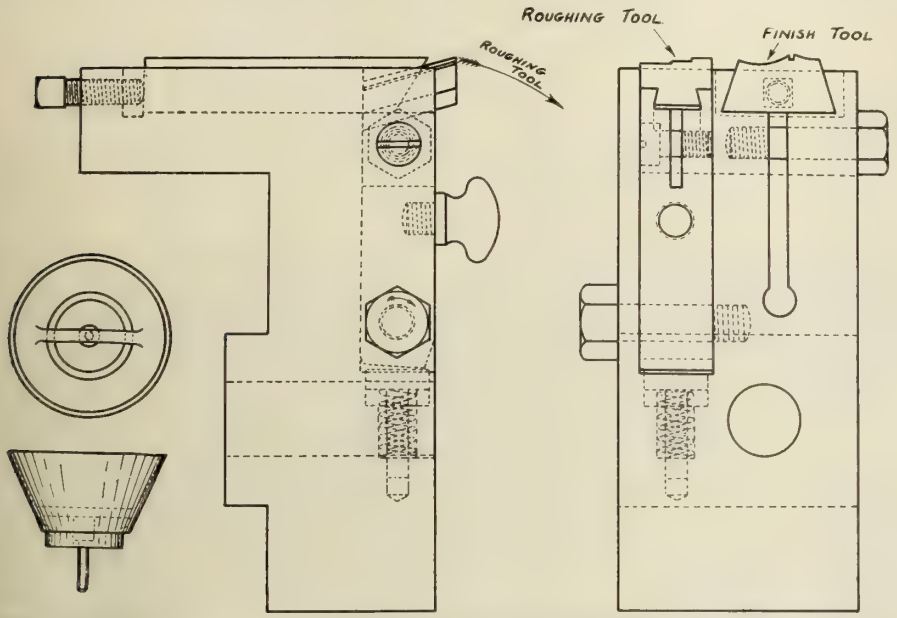

FIG. 32—FUNNEL.

FIG. 31. TOOL HOLDER AND TOOLS FOR FINISHING COPPER BANDS.

this time removed all the shells from the machines to the drying shelves on the walls grasping each by the brass casting and the copper band thus not touching a painted surface. Thus, one man completely painted, priming and finish coats, and red leaded the noses, in twenty-one minutes which is a record accomplishment. The details of the machine are shown in Fig. 36.

on the main floor is located two motor driven rotary gear pumps which supply the soda water cutting lubricant to the pipe line system which in turn supplies water to the various machines. The water all drains back by gravity through strainers and is led into the main sump on the ground floor of the shop. Workmen are provided with tools which are carefully made and inspected by a corps of competent men.

The natural lighting of the shop is by means of large monitors composed of glass and ample skylights. Windows in the side walls also contribute to the good natural lighting. The artificial lighting is from Cooper-Hewitt lamps and nitrogen incandescent lamps, while each operator is provided with an individual tungsten lamp. Remuneration is on the piece work plan in practically all departments where the system can be employed. There are two shifts of 11½ hours each per day with no Sunday work. The entire department shown in Fig. 16 and Fig. 19 is on a mezzanine floor overlooking the main machine shop and erecting shop. The plant is working to capacity and is extremely well balanced.

Fig. 36 and an accomplishment record of this plant will be found on next page.

## SHRAPNEL SHELL SERVICE FEATURES.

SHRAPNEL possesses greater man-killing power than any other kind of ammunition used in modern field artillery, and that is why more than 1,000,000 shells a month are being used by the European armies now in the field. Thousands of shops and factories on this continent and in Europe are working night and day to supply the demand.

A superficial examination of a shrapnel shell discloses little to indicate its destructive power—it is simply a small steel shell attached to the end of a brass case; but when properly adjusted and fired from a modern field gun this steel shell becomes a veritable demon of destruction. Within the brief period of 4¾ seconds it has travelled over one mile, and 17¼ seconds later it is nearly 3¾ miles distant from the gun. At any time during this rapid flight it can be made to explode with marvelous precision and deadly effectiveness.

Each shell has a time fuse made with the accuracy of a watch. This fuse is graduated in seconds, and is set to explode at a given range as determined by the panoramic sight or other form of range finder. As soon as the gun is fired, the fuse is ignited automatically and when the explosion occurs in the base of the shell itself, the forward end is blown out and a shower of lead bullets hurled forward in cone-like formation, the shell acting as an aerial gun. The velocity of

these bullets exceeds the velocity of the shell at the time of the explosion by from 250 to 300 feet per second, and they cover a zone about 30 yards wide and 250 yards long.

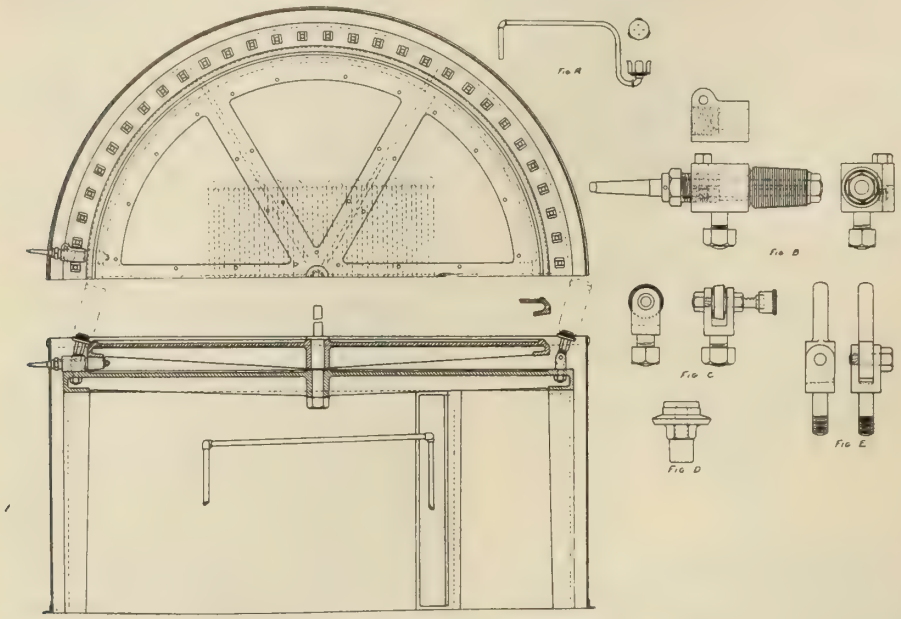

FIG. 36. DETAILS OF PAINTING MACHINE.

A—Bracket to carry paint can made of 1¼-inch pipe and fitting over the central stationary spindle on the machine. B—Laminated leather friction roller; one of three supports carrying the revolving table. This roller acts as a driver for the revolving table; the central spindle is tapered on one end and runs through a brass bush and on out of it, forming the core for the leather laminations which are in the form of a taper. C—Type of idler rollers, of which there are two, supporting the revolving table in conjunction with the laminated leather roller. D—Brass casting to screw into brass socket of shell previous to mounting shell on the painting machine. E—Hinged bolt, of which there are sixty mounted on the frame of the machine. Shell with the castings shown in Fig. D are slipped over the hinged bolts.

### Invented in 1784.

The first shrapnel shell (invented in 1784 by Lieutenant Shrapnel) was merely a cast-iron ball filled with bullets and powder, which was exploded by a crude fuse screwed into the shell. This type was unsatisfactory because bullets flew in all directions when the shell exploded. Later this defect was partially overcome by inserting a sheet-iron diaphragm, which separated the bullets from the bursting charge. Modern shrapnel is similar in principle to its early predecessor, and is a marvel of mechanical ingenuity.

The shrapnel shells used by different governments at the present time operate on the same principle, but differ somewhat as to size and in the arrangement of the fuse. A complete shrapnel shell comprises a brass case containing a heavy charge of smokeless powder for propelling the projectile, a hollow steel shell containing a large number of lead bullets and a bursting charge, and the combination time and percussion fuse which forms the point of the shell. The sudden motion of the shell at the time of firing causes a small plunger in the end of the fuse to fly back and strike a cap which ignites the fuse. This fuse is composed of a slow-burning composition that is pressed into annular grooves. One of these grooves is in a stationary ring and the other in a graduated movable ring. By turning the graduated ring, the length of this fuse is varied so that the shell may be exploded at any time within a period of about 21 seconds.

### The French Fuse.

The French fuse differs from the movable ring type used in other countries, in this respect. The slow-burning composition is contained in a tube wound spirally around the fuse head. The fuse is set by piercing a hole through this spiral tube, so that connection is made with the interior of the fuse body. When the gun is fired and the primer or cap in the fuse head is exploded, a flame passes out through the pierced hole and ignites the "rope" powder fuse. The effective length of the fuse depends upon the position of the pierced hole, which is made by a special machine attached to the gun, the hole being located with reference to suitable graduations. Most fuses are so arranged that the shell will be exploded by concussion if it should strike before the ring of powder burns around to the exploding charge. This is effected by a secondary plunger in the fuse head which flies forward when the shell strikes and fires the bursting charge instantaneously.

Shells of the three-inch size contain from 210 to 360 lead bullets about half an inch in diameter, which are embedded in a resinous mixture. This matrix, as it is called, serves two purposes. It holds the bullets in position, and also acts as a tracer to indicate by a cloud of smoke the point at which the shell explodes. This smoke cloud is important, especially at long ranges, and when adverse atmospheric conditions exist.

A shrapnel shell, in common with other types, must be revolved about its axis during flight to keep the point forward. This rotary motion is imparted to it by a copper band that is pressed into a groove near the base. When the gun is fired, this band, being imbedded into the spiral rifling grooves in the gun barrel, imparts a sudden twisting motion to the projectile.

The combination time and percussion fuse which is screwed into the end of the shell is composed of many parts, which must be made very accurately.

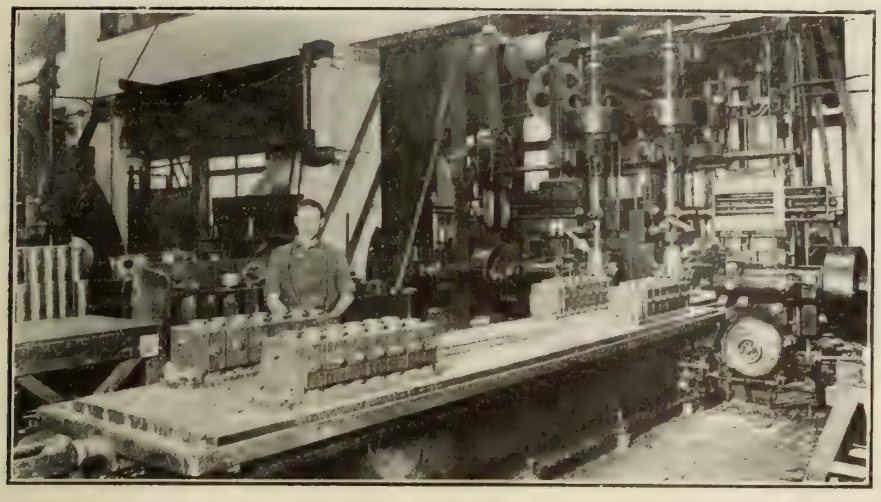
# Shell Manufacture in a General Engineering Plant

Staff Article.

*Perhaps the most fortunate of the various manufacturing institutions in its ability to readily take over the shell business is the general engineering plant. The equipment usually requires comparatively slight alteration, and there are also at hand the type of men and scope for designing and building any necessary special apparatus at short notice.*

THE unexpected change of employment of the greater number of Canada's metal working plants from the production of articles of peaceful commerce to the fabrication of munitions of war has been done at more or less sacrifice depending largely upon the character of the plant. The methods herein described for the manufacture of shrapnel shells are those adopted by a plant whose regular equipment is unusually well suited to the different processes involved. The product for which original machines were installed consists of internal combustion engines in large quantities, and it will be interesting to note the great similarity in the various operations required to those of the more warlike output at present being produced.



CONTINUOUS MILLING OF BASES ON INGERSOLL MULTIPLE SPINDLE MACHINE.

The shells are received at the plant from the steel works in the form of rough forgings. They are unloaded from the cars in a well equipped shipping department on to an auto-car operating on an industrial railway and by means of which they are transported to the shell department beside the machines which perform the first operation—the trimming of the open end. These include a cutting-off machine with two tools and variable feed, a John Hall & Sons, Brantford pipe machine and a heavy standard lathe. The gauging point for this as well as subsequent operations is the bottom of the shell chamber inside.

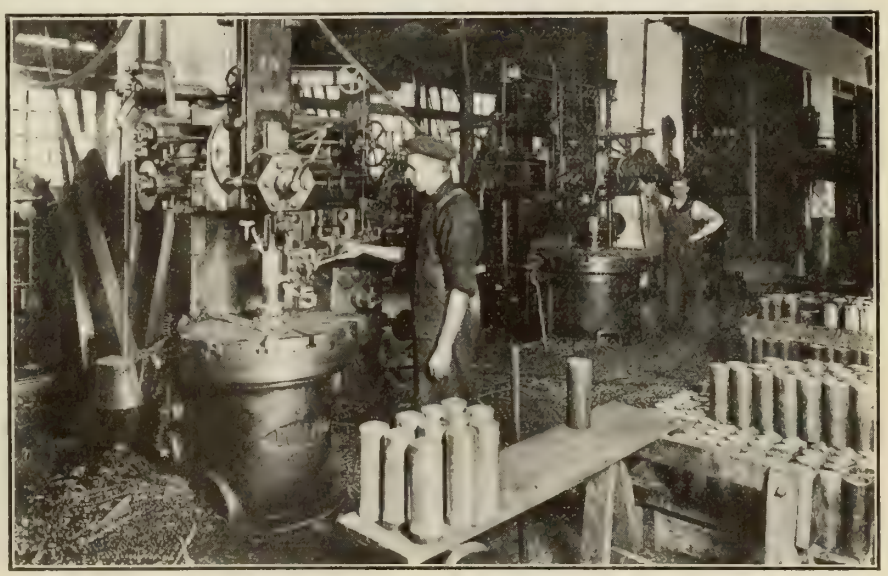
### Use of Milling Machines.

The basing or rough facing of the closed ends is done most efficiently upon an Ingersoll four-spindle milling machine, using the two vertical spindle heads. The platen of the machine carries four fixtures located in pairs near either end. These fixtures hold twelve shells each, arranged in two rows of six. The shell is simply dropped over a vertical gauge pin and is clamped, two shells to a clamp in an upright position.

The milling is done by two large, inserted tooth high speed steel facing cutters, one traversing each fixture. While one pair of fixtures is under the cutters, the operator is engaged, at the other end of the table, in emptying and reloading the other pair of fixtures so that the milling process is practically continuous. This has proved a most satisfactory method of doing this part of the work as the machine is powerful and rigid enough to work the high speed steel cutters to their capacity. Another machine of this type is being fitted up and will be in operation shortly.

After gauging for length, the forgings go to the various machines utilized for the outside turning. For this purpose the shells are driven upon mandrels solidly attached to the face plates of the machines. These arbors are solid and are fitted, upon the shank part, with a circular nut. When it is desired to remove the work, this nut is simply tightened against it and a tap with a hammer upon the side serves to release it instantly.

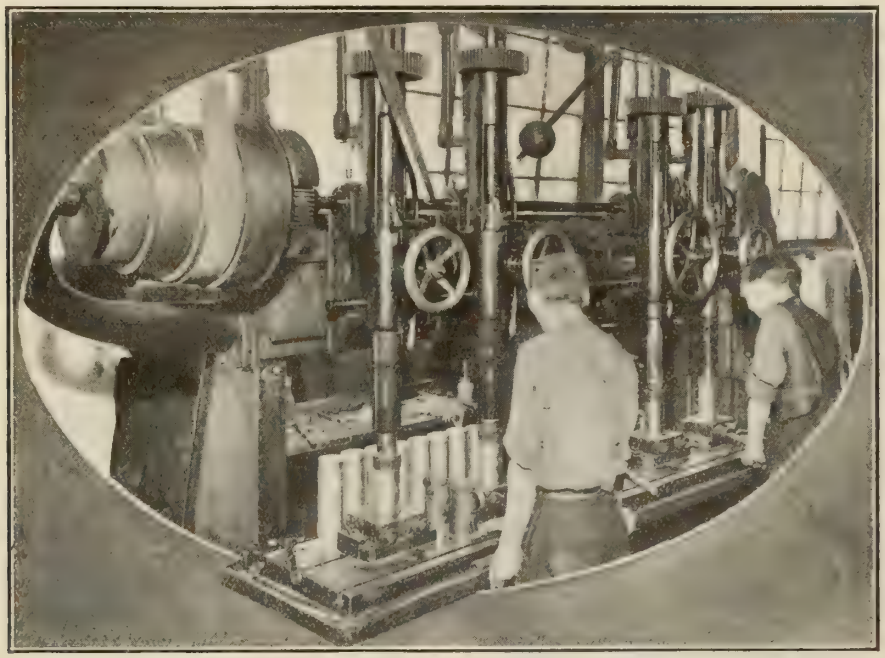
The turning is done on two Bertram and two Bullard vertical turning and boring mills, one Conradson turret lathe, one Gisholt, two heavy Steinle turret lathes and one Pratt & Whitney turret lathe. The Steinle machines are equipped with a special expanding arbor and are used to turn such shell forgings as come slightly large so that they cannot be tightly driven on the solid arbors. The gripping points consist of twelve pins in four circles of three each which are moved outwards against the shell chamber by the wedge action of the



ROUGH TURNING SHELL FORGINGS ON BULLARD AND BERTRAM VERTICAL TURRETS

spindle which is actuated by a nut at the rear end.

It is interesting to note that, in quantity of production, the competition between the several machines is rather close, the Steinles coming first, the Pratt & Whitney second and the vertical boring mills third, although the difference does not amount to more than from six to a dozen per day.



BORING SHRAPNEL CASES ON A FOUR SPINDLE FOOTE-BURT DRILL.

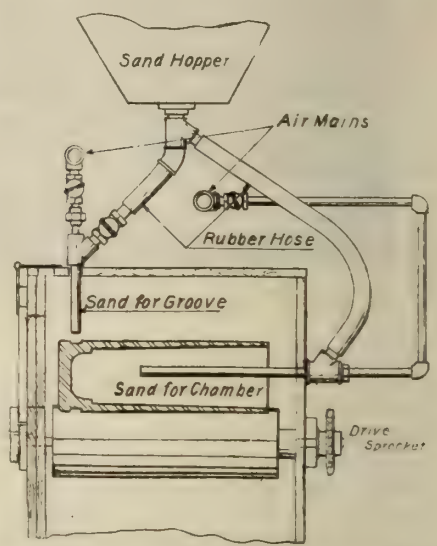
The series of operations consists of rough turning the shell body, finish turning from the band to the base, finish facing the base and roughing out the groove for the band. The work on the groove here consists of cutting down the whole width to the top of the vees of the wave and of cutting down the two edges to the bottom of the vees. The rough turning of the body is carried up to the edge of the part which is nosed in, or, in other words, it involves the cylindrical part of the shell.

NOSE-HEATING FURNACE AND NOSING PRESS.

### Boring Processes.

The next operation consists in boring the shell in the bottom to receive the powder cup and also for the seat of the steel diaphragm which separates the powder from the bullets. This is also carried out on a number of machines of a widely varying nature. These include a Conradson turret lathe, a four-spindle Foote-Burt drilling machine, a Bertram horizontal boring machine, and others. At first sight, the latter machine appears extremely clumsy, and heavy for such work, but such has not actually proved to be the case. The rigidity of the machine and the abundance of driving power make up for a great amount of inconvenience and, what was at first a mere attempt to get something out of the machine and to keep it going has proved to be one of the best single spindles on the job, an output of 90 shells being obtained per eleven hours.

The multiple spindle drill, while being a very satisfactory machine in point of simplicity of operation and quantity of output, cannot be readily arranged to do the facing of the end; this however, is done on a small machine not large enough to do the boring. The boring tools used consist of two solid bars equipped with flat formed cutters, one for roughing and one for finishing. These cutters or bits possess the advantage of being easily made in numbers, and dull cutters can be quickly replaced by sharp ones without materially interfering with the progress of the work. The Foote-Burt machine operates two roughing and two finishing spindles continuously and is handled by two men.

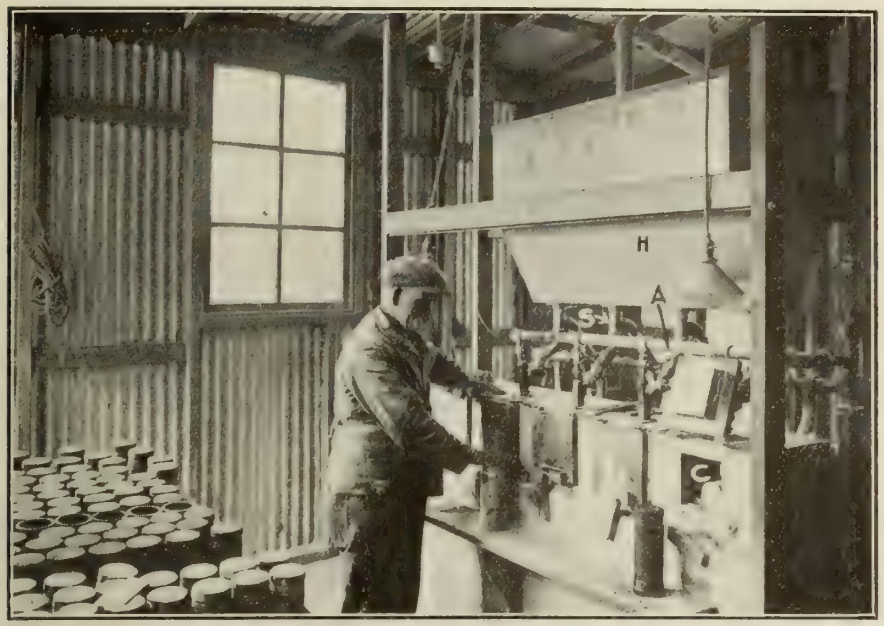


DETAIL OF SAND BLASTING MACHINE.

The next operation is that of waving. This consists of turning in the bottom of the groove for the copper band a pair of inverted vees to prevent the band from turning on the shell as it traverses the length of the gun, so called because the vees are cut, not on a flat but on an undulating plane. The waving is accomplished by a square nosed tool with two vees of the correct dimensions cut in the face of it.

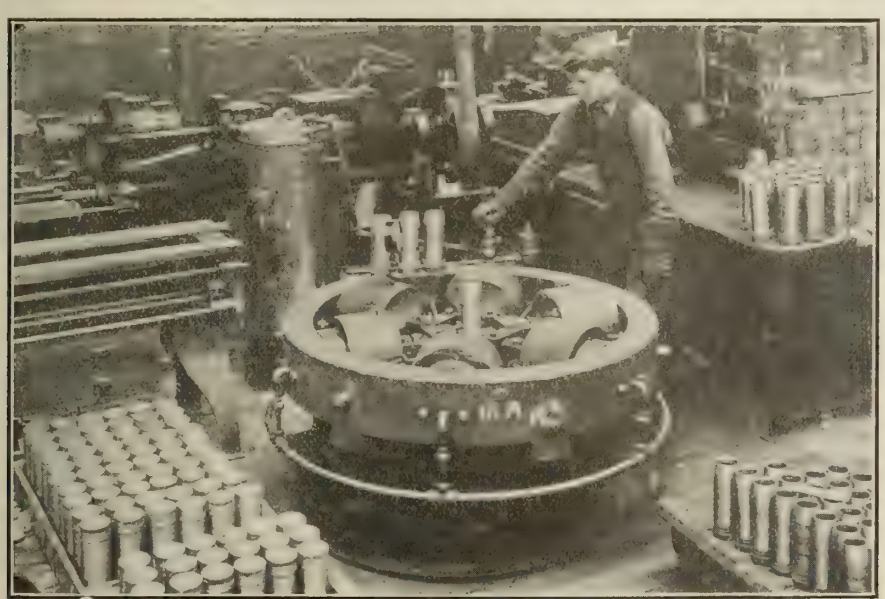
An interesting tool making question here arises as, in order that the angle of the vee be correct on the sloping parts of the wave, the angle of the groove in the tool must be greater. The

lateral oscillating motion is given to the tool by a face cam fastened to the face plate of the lathe. The work is done on two R. McDougall and two Bertram geared head lathes, equipped with special



SAND-BLASTING MACHINE WHICH CLEANS POWDER CHAMBER AND BAND GROOVE.

centering chucks which grip the work by the turned body. The cam roller is fastened rigidly to the lathe carriage and is held to the face of the cam by a suitable weight. After waving, the open ends are turned for heading on a small lathe by hand feed the purpose being simply to true up this part of the shell, and only enough is taken off to accomplish this.



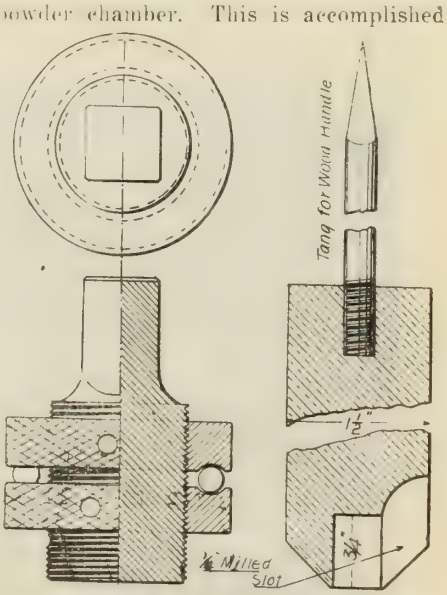
CANADIAN FAIRBANKS-MORSE BRANDING PRESS.

### Heat Treatment.

The shells come to this department placed on end in large trays, open ends up, each tray holding 120. A boy now paints the bases and grooves of the shells with a mixture of whiting and alcohol to prevent oxidation of the finished parts during heating, and returns them to the tray closed ends up. For heating the shells, six lead baths are employed, the warming and final heating taking place in separate baths. These pots are heated by oil burners and the temperature regulation is maintained by electric pyrometers. The work is heated for about half its length and, to accomplish this, it is held in a vertical position by the circular cover plate of the bath which contains four suitable perforations to receive the shells which are held down by a conveniently placed weight.

The hardening is accomplished by dipping in oil, three tanks approximately 4 ft. by 2½ ft. by 2 ft. being used. The dipping is done with the open end of the shell entering the oil at an angle of about 45 degrees and is quickly reversed so that the base turns downwards. After chilling the shells are inverted upon books placed at the back of the tank to drain and are subsequently removed, cleaned and tested for hardness. For this, the well known scleroscope is used. The test must be applied at a specified distance from the end of the shell and at least three points in its circumference. A feature of the use of the scleroscope for this work is the rapid wear of the bulbs. Unless the very best quality is obtained these wear out at the rate of about one per day.

The next step in the process is sand blasting the groove and the inside or powder chamber. This is accomplished



BALL-BEARING DRIVER FOR SOCKETS, ALSO SOLDERING COPPER.

by means of a very simple and most ingenious machine, devised and built by the Canadian Fairbanks-Morse Co. The apparatus consists of four compartments each just large enough to accommodate a shell and is closed by a wooden door. The shell rests upon a pair of live rollers so that it rotates continuously. One nozzle enters the open end and directs its flow of sand at the internal surfaces to be cleaned while another, in a vertical position cleans the groove and its undercutting. There are of course, four pairs of nozzles and the process is completed as fast as one man can handle the shells.

The forming of the nose is done on a heavy geared stamping and forming press. The furnaces used here are worthy of note. These are the usual oil heated lead baths covered with circular plates containing four openings to hold shells in the proper vertical position. The plates are connected to vertical spindles provided with four arms at

the top so that, as a hot shell is removed and replaced by a cold one, the disc plate can be rotated a quarter turn to bring a fresh hot shell into position for the press man. The shells after nosing are allowed to cool slowly.

The final operation on the base of the shell consists of cleaning and polishing on a rag wheel to remove all signs of the heating operations. The machining of the nose constitutes another series of operations, the first of which is the rough turning of the outside. This is accomplished by means of a plate carrying a cam slot and attached rigidly to the bed of the machine. This slot effectively guides the cam roller which is rigidly connected to the lathe cross slide and thus restricts the motion of the tool so as to give the correct contour to the shell nose.

The roller is held securely to the guiding face by weights and the feed of the tool is regulated by stops, a solid plate gauge being used to test for size over all. The nose is bored in the same way after grinding with an ordinary diamond point tool held in a short stout boring bar. The lathe carriage is guided in a cross-wise direction by means of a cam attached to the rear of the lathe bed as before.

The finish facing and tapping are done on turret lathes, a solid tap being used which is backed out by reversing the lathe spindle. The shells are now ready for grinding for which three Norton grinders are used. The finishing of the shells by grinding is considered a success in every way by the management of this plant and they have deviated but little in their methods from standard practice.

The shells are centred by chucking at the rear end and by means of a plug carrying the centre at the front end. The machine is traversed in the usual way in grinding the cylindrical part of the work and a formed wheel is used only to finish the profile of the nose. Two plain grinders and one formed wheel grinder handle the output of the plant. The diamond problem is overcome by avoiding, as much as possible, wide formed wheels and the men in charge express themselves as well satisfied with the results. Following the grinding, the inside of the nose is turned to size and the shells receive their preliminary shop inspection in which particular attention is given to the undercutting and waving in the groove for the band. After this the shells receive their first government inspection which follows somewhat similar lines to the shop inspection.

### Banding Operations.

The work in connection with the copper rotating band consists of a series of operations. The marking is done at this point upon a Holden Morgan marking machine and the bands are crimped in place by means of a hand lever press which sets it down into the groove at four points in the circumference. The banding press is of the hydraulic six-cylinder type, built by the Canadian Fairbanks-Morse Co. So successful has this press been that the company has undertaken its manufacture, and has sold a considerable number to other people engaged in the shell business. The machine is operated by a belt-driven pump, and has a number of interesting features. The shell is placed, open end uppermost upon a small plate at the centre with the pistons working radially towards it, and the band is pressed home in two operations between which the shell is given an eighth of a turn so that the entire circumference is affected. The press is quick acting and the entire operation requires less than one minute.

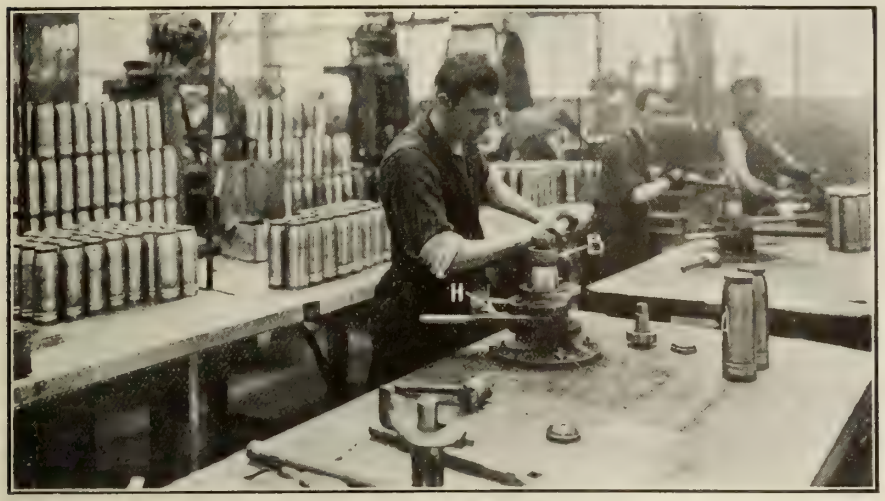
The turning of the band is done on small lathes using flat formed tools. The main tool is situated on the carriage in the usual place while a smaller tool located in the centre of the carriage, so as to operate on the bottom of the work when the cross feed is reversed, is used to turn the flat parts of the band. A brass plate which acts as a rest for a band tool is now slipped over the main forming tool and all burrs and ragged edges are removed from the turned band in this way.

GENERAL VIEW OF ASSEMBLING DEPARTMENT—PLACING POWDER CASES AND TUBES, FILLING WITH BULLETS AND RESIN, WEIGHING, PLACING SOCKET, ETC.

### Assembly.

The case of the shrapnel may now be considered finished and only requires assembling with the interior parts. These consist of the tin powder cup, the diaphragm, a brass tube leading down through the centre and which screws into the diaphragm, the bullets and rosin matrix, the cap and plug, and several bits of muslin solder, etc. The first operation consists of placing the tin powder cup beneath the steel diaphragm which was placed in the shell previous

to the nosing operation. The tubes are now screwed in place and a felt plug upon the end of a wire is inserted to prevent all particles of material or foreign matter from entering the tube or mass. It has been the experience of the officials of this plant that this is a most important point as the space cannot be perfectly filled by the bullets if these be dumped in bodily.

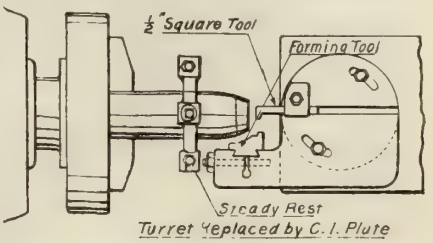


SHELL VISE AND BALL-BEARING PLUG FOR SCREWING DOWN SOCKET.

the powder case. This stopper remains in place until the completion of the assembly.

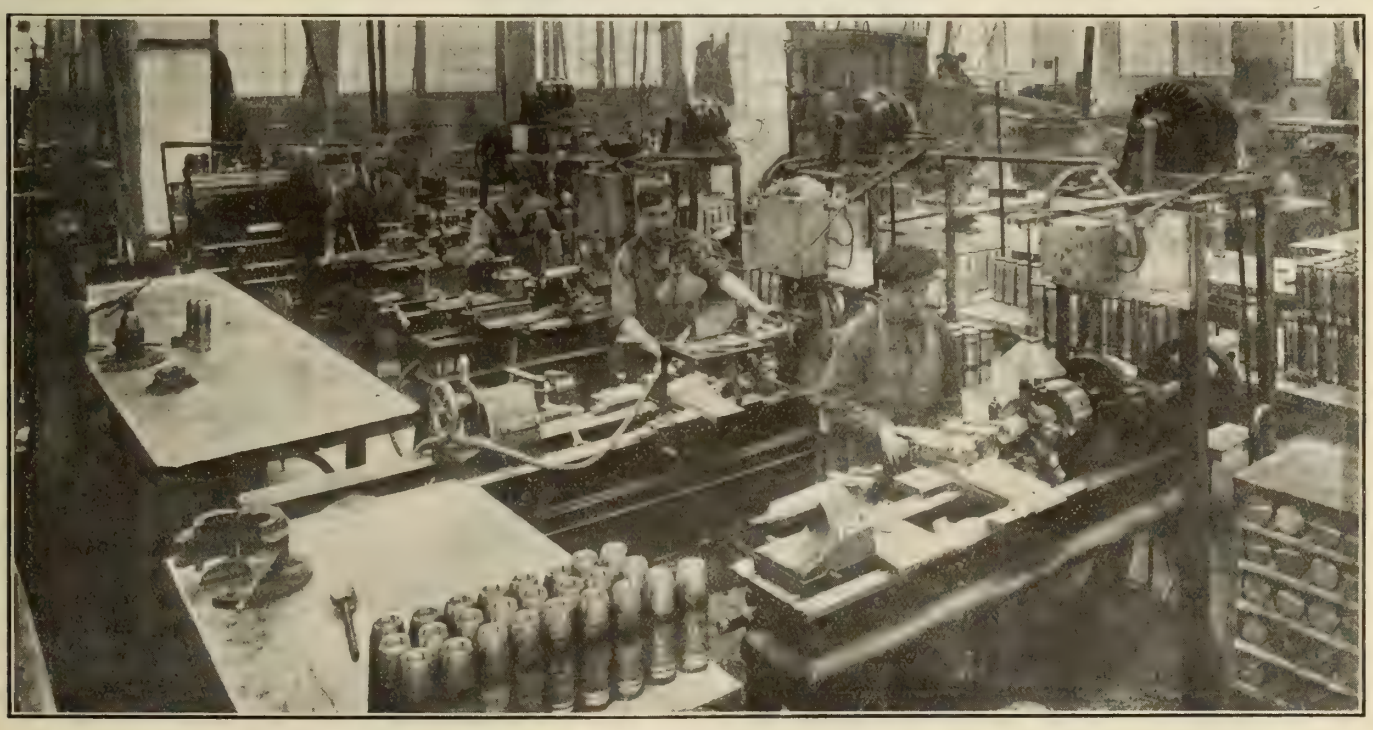
The bullets are stocked above on the gallery of the shop and come down to a filling trough by gravity through a tube in the same way that the diaphragm discs come down to the nosing press. This saves a considerable amount of floor space at points in the plant which are of necessity very much congested. The spout delivers to a trough at the end of which is a filling device especially designed to deliver the bullets to the shell in a steady stream rather than in a mass. To insure the bullets being thoroughly packed, the shell rests during the process upon a vibrator plate which vibrator is very similar to that used on matched plate moulding machines. Short, rapid motion has been found to give better results than a longer and slower motion. The correct number of bullets is ascertained by weighing after which the shells go to the rosin pots. The bullets are not heated as is done in many plants, this being considered unnecessary if due care be exercised in the pouring of the rosin and in maintaining it at the proper temperature. Experience and the making of sections of a number of finished shells have amply born out this practice in a very satisfactory manner.

After filling, the shells are again corrected for weight and are ready for screwing in the sockets. For this purpose, the case is firmly held in an upright position by a special vise operated by a lever and cam. The threads and seating parts of the socket are first luted with shellac and then screwed



FOX TURRET LATHE WITH TURRET REPLACED BY SET-UP FOR FINISHING SOCKETS.

home by means of a special ball-bearing driver and a large, single-ended tap wrench . The plug used for this purpose is a very simple and efficient affair. It consists of the squared shank and a straight, threaded portion of the same diameter and pitch as the inside threaded part of the sockets. Upon the upper part of the thread are two hardened steel nuts fitted with grooves on their adjacent sides to form the raceway for a ball bearing B. The bottom nut seats against the socket to be screwed in and is jammed by the upper nut on account of the much greater friction in the thread bearing than in the ball bearing. For the same reason, the backing of the wrench instantly releases the plug from



FINISHING SOCKETS ON STANDARD LATHES WITH FORMED TOOLS.

the socket from which it can be unscrewed by hand.

The tube is soldered to the socket by means of a special copper formed in the shape of a ring of the right size and provided with a groove on one side to allow the escape of air. The solder is used in the form of wire which is first coiled and then cut into rings, no acid being permitted in the process.

GROUP OF GOVERNMENT INSPECTORS.

Finishing the outside of the socket in conformity with the general contour of the shell nose is done on four small lathes equipped with formed tools and steady rests. These lathes remove all surplus solder and in doing this perform the last manufacturing operation upon the shells. The latter now receive their final shop inspection and are passed on to the officials of the government for their final gauging and inspection. Upon their being passed and the receipt of favorable report from the firing test, the shells are painted to prevent deterioration by weather conditions.

### Tests.

It will be remembered that, at the preliminary inspection, two were chosen from each series of 120, one of which was to be prepared and sent to the arsenal for the firing proof and, from the other, a section is to be cut out as designated by the inspector for the preparation of a specimen for the tensile test of the steel. The shells are painted on a very ingenious machine designed and built by the Canadian Fairbanks-

60—Fairbanks-Morse painting machine.

Morse Co. This machine like the banding press is being constructed in numbers and sold to other shell manufacturers. It contains six vertical spindles spaced evenly about a flat circular table. These spindles are kept in constant rotation at a speed of about 250 r.p.m. by a motor at the base and which receives its current through a lamp socket from the ceiling. The shells are placed in an inverted position upon the upper ends of the spindles, the friction being amply sufficient to drive them with the necessary force. The painting is done with a flat pad from paint receptacles conveniently attached to the machine. The table revolves upon ball bearings and the whole is on wheels so that it can be readily moved to the work. The time required for the painting is one minute per shell for the three coats as specified by the government.

PAINTING, FINAL INSPECTION AND CRATING.

The shells are removed from the machine with a special holder that grips them by the copper band and are placed in racks to dry. After the painting is completed, the shells are finally inspected and packed in wooden cases holding six each. These are loaded upon an industrial railway car and taken to the shipping department whence after inspection of the cases, they are loaded into railway cars two tiers high and start upon their long journey to France, and after loading with the powder charge and primer, to the battle fields.

### System a Factor.

The most striking point in connection with this plant is the evident perfection of the system employed. From the moment the forgings reach the plant, not a backward movement is made. The flow of the shells through the plant is smooth and uninterrupted and at no point do the streams cross over. The result of this is evident. Foremen and superintendents are conspicuous by their absence in the shop and are to be found in the office attending to business.

The transfer truck and pyramid system is used almost entirely and the shells are unloaded upon the floor only where absolutely necessary. Another striking feature is the utilization of all the machinery of the plant both great and small, the devices to this end being in many cases original.

The company has bought little if any outside machinery. On the contrary, the special machines required have been designed and built within the plant and many have been sold to outsiders. The co-operation of Canadian manufacturers in assisting each other in this and in other ways has not only been the surprise of the business to foreign companies, but has been perhaps the greatest factor in the successful handling of this great work by Canadian financiers and manufacturers.

## VARNISH TREATMENT OF LYDDITE SHELLS.

By D. B. H.

FOLLOWING the article by the writer in your Shell Number of March 18, on the heat treating of shrapnel shells, the attention of those engaged in the manufacture of lyddite shells is drawn to the fact that there has been developed an automatic electric oven for the purpose of baking the varnish which is placed on the inside of these projectiles.

The oven is constructed of steel angles and channels in combination with special heat insulating material. The door opens flush with the floor and is raised by a balance weight from the rear so as to readily permit the laying of tracks into the oven, on which the shell trucks may be run. The heating elements are conveniently placed in the bottom of the oven between and underneath the tracks. The current is fed to the heating elements through a thermally controlled switch arranged to turn the current off or on as required, so as to maintain a constant temperature in the oven without attention from the operator. This results in a very considerable saving of current, for as soon as the proper temperature, 300° F., is reached, the current is automatically cut off, and, as the oven walls do not radiate the heat, it takes a considerable time for the baking shells to lower the temperature 2 or 3 degrees, when the current is again automatically turned on for a few minutes to bring the temperature back to the required point. This gives an oven which, besides producing the best results in baking, can be operated with the greatest economy and speed

BRITISH GUNNERS MOVING HEAVY PIECES OF ARTILLERY.

## FIRING A SUBMERGED TORPEDO.

THE main armament of a large warship consists, as everyone knows, of guns; but it is not so generally known that the submerged torpedo tube is a part of the auxiliary armament of every large war vessel. The battleship's torpedo tube is always situated well below the waterline, and it is fixed relative to the ships. In the earlier submerged tubes efforts were made to train them, but the idea involved so many complications that it was abandoned, and fixed tubes are now universally fitted.

### The Torpedo Tube.

The torpedo tubes themselves consist of a cylindrical vessel, one end of which is attached to the ship's side, and fitted with a sluice valve. The tube is loaded either through the end, or, as in most of the later types, at the side. Elaborate arrangements are provided to prevent the possibility of the torpedo being discharged until the valve at the ship's side is open, and the tube is in communication with the sea. It is also impossible to open the end door of the tube, if the sluice valve is not shut.

### Discharging the Torpedo.

The torpedo is discharged from the tube either by means of compressed air, cordite, or powder. If the ship were travelling at a high speed when the torpedo is fired, the nose of the latter would be twisted round, and its tail would probably jam in the valve. To prevent this, a bar or spoon is made to project out from the ship's side to guide the torpedo until it is clear of the hull. This bar is either run out just previous to firing, or else it is fired out at the same time as the torpedo, and returns automatically after the torpedo has left.

To discharge the torpedo at the right instant, it is obvious that the firing must be done some distance from the tube itself, from a position where the target can be observed. A firing director is usually fitted in the conning tower. This consists of a sighting device and a firing key. At the right instant the key is pressed, and an electric current does the rest. The firing director is provided with arrangements for making the necessary allowances for the estimated speed and course of the enemy, and the speed of the torpedo itself, the latter being different for different ranges.—Liv. Journal of Commerce.

## ENGINEERING AND ARMY SUPPLIES.

MOST interesting corroboration comes in a despatch from the "Eye-Witness" present with the British General Headquarters, concerning the part played by engineering workers in maintaining the supplies to our Army in the field.

A good deal has been said at different times about the way in which our troops are supplied. It is possible, however, that by some of those who are not conversant with military phraseology the term "supply" may be taken to be applicable only to the feeding of an army. This is not the case, for essential as is food, its provision is only one part of the problem of maintaining a force in the field. To be efficient as a soldier a man requires more than the adequate nourishment of the body.

### The Different Branches.

The scope of the branches into which the whole subject of supply is divided is somewhat complicated, and can not be accurately explained in a few words, for these branches are not all exactly defined, and in some cases overlap. It may be said that the furnishing of food of every kind for man and beast is the duty of the Army Service Corps, the furnishing of every drug and appliance necessary for the treatment of the sick and wounded is carried out by the Royal Army Medical Corps, assisted by the various voluntary organizations, which started their effective work when war began, while the provision of stores for disabled animals falls to the Army Veterinary Department. The Royal Flying Corps purchases its own machines, as does the Mechanical Transport Branch of the Army Service Corps. Broadly speaking, however, with these exceptions, the Ordnance Department supplies the Army with all the clothing, equipment, arms, ammunition, tools, appliances, machinery and expendible material that can be required, from guns weighing many tons to tin-tacks.

### Vastness of the Work.

The vastness of the work of maintaining the army—apart from feeding it—may be gauged from a few figures. In one month there were issued to the troops 450 miles of telephone wire, 570 telephones, 534,000 sandbags, 10,000 lb. of dubbin for boots, 38,000 bars of soap, 150,000 pairs of socks, and 100,000 pairs of boots. In ten days the number of fur waistcoats given out amounted to 118,160, while during the same period 315,075 flannel belts were distributed. The way that insignificant items mount up where large numbers of men are concerned is shown by the fact that the weight of the average weekly issue of vaseline for the feet is 5 tons, and that of horseshoes 100 tons.

### Vocabulary of Stores.

On the other hand, some idea of the complexity of the work can be gathered by reference to the official "Vocabulary of Stores" which corresponds to the price-list of a large shop, and contains 50,000 separate items. The different patterns and varieties of the same article

stocked is also somewhat surprising. For instance, there are several hundreds of kinds of spanners in use in the Service, spanner No. 203 being listed as required for "gland and valve of cap securing inner chamber of air-cylinder and filling valve, spindle intensifier; barbette, B.L., 9.2-in., Mark IV., also filling and emptying valve gland air-cylinder; barbette, B.L., 9.2-in., Marks V. to VB." Even such unusual demands have been made as those for bitter aloes—to put on head-ropes to prevent horses biting them—and permanganate of potash for dyeing grey horses brown.

Not only is the variety of the stores used greater than it was formerly, but each article tends to become more complicated in itself. Guns, and their mountings and carriages, and ammunition, with its delicate fuses, the handling of which originally formed the chief duty of the department, are, of course, far more elaborate than they used to be, as are the electrical instruments used by the engineers for telegraph, wireless, and telephone—the employment of which has to such a large extent superseded the old simple flag and lamp signalling and heliography. Even such things as water-carts are now fitted with an elaborate arrangement of filters.

### Supply and Maintenance.

The duties of the department can be divided into those of supply and maintenance. The first consists of estimating betimes what will be required, of framing scales of issue and checking demands for it, of ordering, procuring, and testing or making it, of providing the troops with it, and of accounting for it afterwards. In most cases the articles used by the Army are made either in Government or private factories at home; but some are manufactuerd by the Ordnance Department in its own workshops in France.

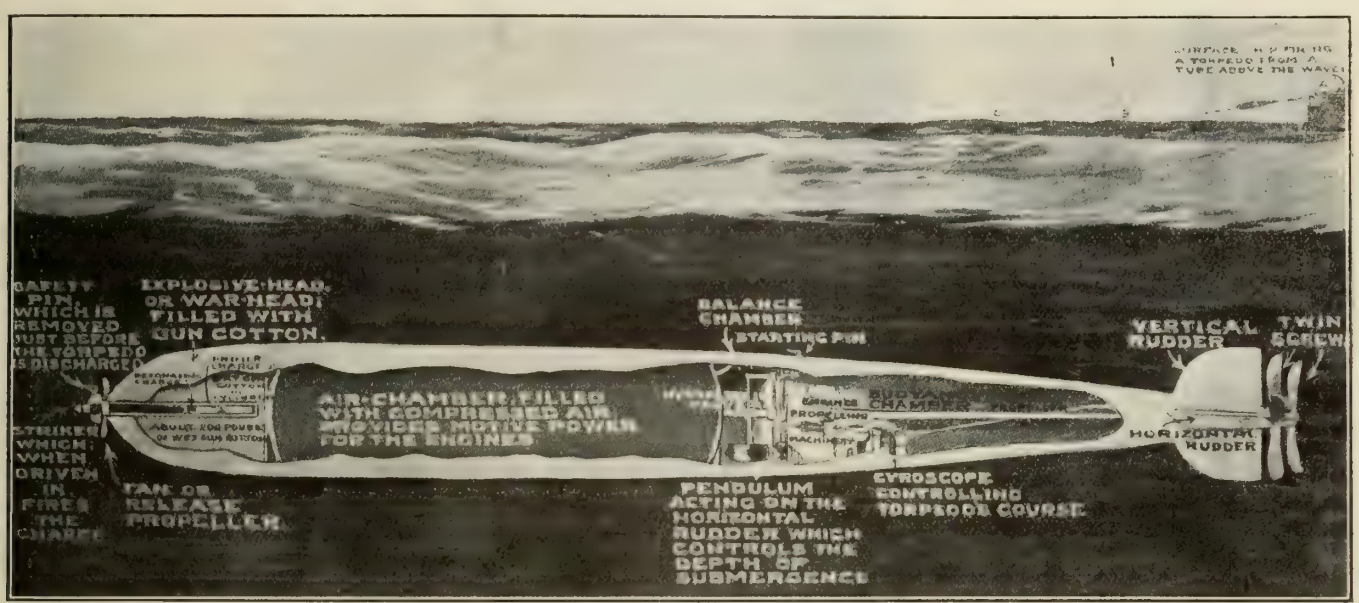
In the case of anything of a mechanical nature, the duties of the "Ordnance" are not finished when the article is handed over to the troops who use it, for it is still carefully watched, gauged, and tested, maintained in order, and, if necessary, repaired or replaced. The importance of this work in connection with guns, ammunition, or explosives needs no emphasis. To carry on, indeed, the officers and men of the department must not only possess a knowledge of their own work, but have to be well acquainted in the establishments, formations, and requirements of every kind of unit. For the testing and repair of machinery there is a specially and technically-trained staff of officers, warrant officers and men, and stationary and travelling workshops, whilst all armourers, whether employed in the ordnance workshops or with regiments belong to the department.

### Distribution.

It must be remembered that since the units of an army on active service are either fighting, or waiting ready to fight, and are therefore scattered over a large area, the problem of distribution, whether it be of food, ordnance stores, parcels or letters, is bound to be one of great difficulty. It is in most cases impossible for the soldiers to go collectively or individually to some central depot or shop, where they can draw what they want. The stuff must be taken out and delivered to them. This, of course, applies equally to the question of food; but there are two points which make the distribution of ordnance stores less easy than that of food, and that is the variety of the former and the fact that some of them have to a certain extent to meet special requirements.

Briefly, the procedure adopted to ensure that the troops receive promptly what they need is as follows:—For all ordinary stores for which there is a steady demand, and of which an estimate of requirements can be framed in advance, the ordnance officer with a division sends down to the base—which is really a depot or reservoir of stores—an order for a week's supply made out in anticipation. If this order were complied with at one stroke, and the whole of the week's supply sent up in one consignment by rail from the base to rail-head—the point where railway transport ceases—the result would be congestion and confusion, for the mass could not be handled and sent out to the troops at once, nor could it be stored where it was unloaded. Moreover, it might happen that the troops would not at the moment be in a position to take delivery of the stores for which they had asked. From the base, therefore, a proportion of the weekly demand is sent up to railhead daily, and from this amount the divisional ordnance officer is able to satisfy each day part of the current requirements of the units.

Two great principles which are strictly adhered to are, on the one hand, not to unload from the rail, and accumulate a stock at a temporary point, such as railhead, where it cannot be handled, and,



SAFETY PIN, WHICH IS REMOVED JUST BEFORE THE TORPEDO IS DISCHARGED

VERTICAL RUDDER
TWIN SCREW
AIR-CHAMBER, FILLED WITH COMPRESSED AIR PROVIDES MOTIVE POWER FOR THE ENGINES
HORIZONTAL RUDDER
STRIKER WHICH, WHEN DRIVEN IN, FIRES THE CHARGE
FAN OR RELEASE PROPELLER
PENDULUM ACTING ON THE HORIZONTAL RUDDER WHICH CONTROLS THE DEPTH OF SUBMERGENCE
GYROSCOPE CONTROLLING TORPEDO COURSE

CHIEF WEAPON OF THE SUBMARINE THE TORPEDO, ITSELF A SMALL AUTOMATIC SUBMARINE.

The machinery for super-heating air, which has increased the range of the torpedo to so considerable an extent, is not shown in the diagram, as it is a secret. The letters at and near the surface ship refer to the following:—A—Safety pin removed just before the torpedo is discharged. A to B—Delay action check is placed on the engine during pasage from A to point of striking water. B. At B the water turns the fan, or release-propeller. At C the fan is fully unscrewed, and the striker-rod is free to act after a small pin (a third safety-check) has been broken by the striker being driven in by impact with the object attacked. From B to C is forty feet.

—Cut and Data, Courtesy "Illustrated London News."

on the other hand, not to lock up railway rolling stock by keeping trucks under load. To avoid a block, therefore, it pays to send back to the base the unexpended balance of a day's consignment which is not issued to troops on arrival at railhead.

**Intermitten Demand System.**

For all technical stores for which there is not a steady demand and which are not required in bulk the system is different. The divisional ordnance officer wires to the base to send up from stock at once whatever is required. Once on rail, ordnance supplies follow the same channel of delivery as the food. Up to railhead they are conveyed on special trucks in the supply trains and thence by motor transport to the refilling stations, whence they are taken up to the fighting line in the horsed vehicles of units. So far as the ordnance is concerned, the base, besides being a depot, includes huge workshops.—Engineering.

## MINES AND MINE-SWEEPERS.

By G. J. W.

ONE frequently sees in the daily press during these troublous times the statement, "Struck a mine—sank in a few minutes," followed by the name of the ship, her value and that of her cargo, and the fate of the passengers and crew. The many such happenings of this nature serve to indicate the important role being enacted by the submarine mine in the present war.

The first appearance of the submarine mine was during the revolution of Britain's American Colonies, when it was described as an "infernal machine of Yankee introduction," outraging all the principles of warfare.

David Bushnell is credited with the conception of the idea and, in order to put the mine to a practical use, designed and constructed one of the first attempts at a submarine boat. The boat was nearly egg-shaped, with room enough to contain a single operator. He propelled the machine by means of treads, which conveyed the foot power to a couple of paddle wheels on the outside. The idea was to approach close enough to an enemy ship usually at anchor, with the minimum possibility of detection. The mine was simply a large keg filled with gunpowder, ignited by a fuse, and so attached to the exterior of the "submarine" as to be easily detached by the operator at the critical moment, the fuse being timed to allow the submarine time to escape the effects of the explosion.

The scheme was certainly clever in conception, but lacked effectiveness at the practical test, as not a single ship was destroyed, and for the time being the mines became a standing joke in the incident known as the "Battle of the kegs," when Bushnell let loose a flotilla of his mines at the British fleet in Philadelphia harbor. The ships were so manoeuvred that their gunners were able to destroy the mines without loss to themselves. The British navy was considerably affected by this invention, and although not a single ship was lost, it can be considered a creditable result that the morale of the fleet was at least upset.

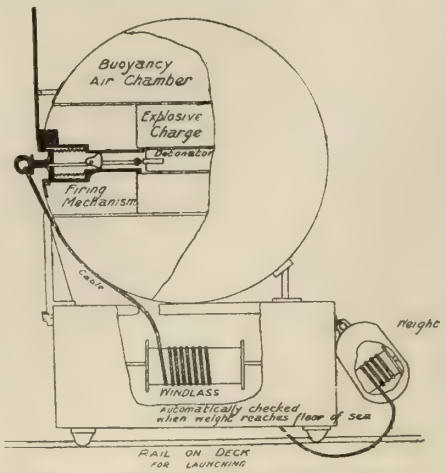

FIG. 1. SECTION OF MINE SHOWING METHOD OF OPERATING.

When Bushnell gave up his efforts, Robert Fulton took up the machine, but after spending much time and money in improving it, he was unable to interest France, England and the United States respectively, eventually giving up the mines and torpedoes to turn his attention to the steam engine. Eventually Samuel Colt perfected a scheme to explode fixed mines by electricity, and this brought the mine into use for harbor defence. The British used this mine in blockading Sevastopol during the Crimean war, and in the American Civil War they were used by the South against the Northern gunboats on their rivers.

After this, European nations took up the manufacture and, incidentally, improvement of the mine, thereby making it not only effective but also a legitimate weapon in warfare. It does not, however, seem to have been fully appreciated until the Russo-Japanese War, where its scope was widened from the limits of defensive warfare to offensive work against the enemy in open waters. Considering the smallness of the fleets engaged, the loss of 14 Russian and 10 Japanese warships was enormous, and at the time placed the mine far in advance of torpedo work. Since then, the floating mine on the high seas has been used as a method of offence, but it has the uncertainty of hurting friend and foe alike, becoming immediately a menace to all when once it is sown.

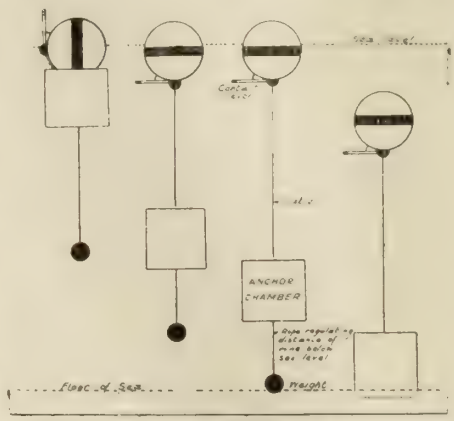

FIG. 2. ARRANGEMENT FOR ANCHORING MINES.

In 1907, before the Hague Convention, the British delegates proposed a rule prohibiting the laying of mines on the high seas, with the exception of permitting belligerents to lay them within a zone of 10 miles from the shore off any naval ports, shipbuilding yards and graving docks, providing due notice was given to neutrals and steps taken to prevent merchant ships being exposed to danger. The proposal was not accepted, and we have seen in the present war what the effect has been.

Most of the mines used are contact mines, and consist of the mine itself, as shown in Fig. 1. A lever is so placed as to explode the charge, while the anchor chamber with attached weight is so arranged as to pay out sufficient cable to maintain the mine at a proper distance below the surface. Fig. 2 shows how a mine adjusts itself after being dropped overboard. The anchor chamber pays out cable, and sinks until the weight reaches the bottom. This checks the cable's unwinding and pulls the mine below the surface.

The only possible defence against mines is countermining and sweeping. The former is carried out by detonating high explosives amongst them and setting them off. The more effective method, however, is removal altogether by "sweeping" operations, which are carried out usually by vessels of light draught. In the present war, steam trawlers and herring drifters have been pressed into use, and have given a good account of their capabilities for the work, although they have by no means been allowed to do so without numerous disasters and loss of life to those on board.

Two vessels proceed through the mine field abreast of each other, say, from 100 yds. to 200 yds. apart, and drag over the mine field a length of heavy chain or wire, which is connected at its ends to the two mine-sweeping vessels. The chain, as it is dragged over the bottom, engages such mines as lie in its path, which are destroyed by contact with each other or by a few well-directed shots from the vessels of the mine-sweeping fleet. The fleet usually consists of six vessels, working in three pairs and under the charge of a commodore.

## G.T.R. APPRENTICES' BANQUET.

AT the third annual dinner of the apprentices of the motive power department of the Grand Trunk Railway System, Montreal, on the evening of April 16, about 200 apprentices, and men who had been apprentices, were present together with a number of prominent officials of the Company.

A. A. Mavor, master mechanic, took the chair, and amongst those at the head table were Brigadier-General Bertram, R. S. Logan, H. R. Safford, J. Pullen, D. E. Galloway, J. Burrows, R. Patterson, W. D. Robb, T. McHattie, J. Markey, J. R. Donnelley, C. Manning and James Powell.

The toast of "The Grand Trunk Railway System and Its Apprentices," was proposed by Brigadier-General Bertram, of Dundas, who dealt in his address with past days, when no such training system was in force, and showed the benefits that were being given both the employees and the company by the present system.

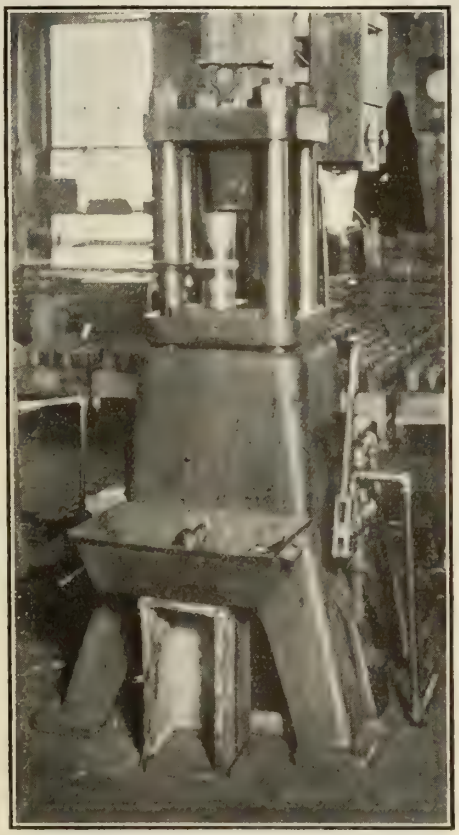
Vice-President R. S. Logan was the first to reply to the toast, and he remarked that the Grand Trunk Railway apprenticeshop system was the best on the continent, and was producing the best results.

W. D. Robb, superintendent of Motive Power, who has had much to do with the work of the apprentice system, followed, and complimented the young men on the manner in which they had arranged the banquet. Other roads, he said, occasionally gave banquets to their employees on the completion of an important piece of work, but it was a unique affair on any railway in America, outside of the Grand Trunk, for such employees to banquet their officials, and for the officials to attend and encourage the younger men to go on with their work.

## E. H. MUMFORD DEAD.

E. H. MUMFORD, very prominent and well known in the molding machine manufacturing industry, died on April 18 at his home in Plainfield, N.J., following a short illness. Mr. Mumford was born in Groton, Mass., 52 years ago. He received his education in New England, graduating in 1886 from the Massachusetts Institute of Technology. In that year he was one of six members of the graduating class who were selected by Charles Francis Adams, of Boston, to serve a course of training in the shops of the Union Pacific railroad.

In 1890, Mr. Mumford left railroading to take a position as foundry superintendent of the Henry R. Worthington steam pump foundry, then located at Elizabethport, N.J. Some time later, Mr. Mumford became the New York representative of the Bement-Niles Co., Philadelphia. About 1895 he went into partnership with Harris Tabor to form the Tabor Mfg. Co., which engaged in the manufacture of moulding machines designed by Mr. Mumford. These machines for several years were made at



GOLDIE & McCULLOUGH CO. NOSING PRESS.

the plant of Samuel L. Moore & Sons Corporation at Elizabethport.

In 1900, this business was moved to Philadelphia and Mr. Mumford remained identified with it until 1905, when he left the Tabor Mfg. Co. and formed the E. H. Mumford Co., which also located in Philadelphia. In 1909, the E. H. Mumford Co. was sold to the Mumford Molding Machine Co., and of the latter company Mr. Mumford was vice-president and general manager until last November.

Since then Mr. Mumford had revived the E. H. Mumford Co. and made arrangements once more for the manufacture of molding machines at the plant of Samuel L. Moore & Sons Corporation, at Elizabethport. The business will be continued by E. W. Mumford and T. J. Mumford, who are, respectively, vice-president and secretary of the E. H. Mumford Co.

## HYDRAULIC BANDING AND NOSING PRESSES.

THE two hydraulic presses herein described and illustrated are built by the Goldie & McCulloch Co., Ltd., of Galt, Ont. The nose press is designed for nosing shrapnel shells up to 18-pounder size, and is a vertical press of the four-post type, with one 10-in. ram of 2⅝-in. stroke, and designed for pressures up to 1,200 lbs. per square inch, or 47 tons on the shell being treated. The cone-shaped nose die is fitted to the upper platen, and the shell is placed on the top of ram, which forces it up into the upper die, thus forming the nose. The capacity of this unit is about 60 shells per hour.

The banding press is designed for compressing the copper bands on shrapnel and other projectiles up to 4.5 in. diameter, and is circular in form. The outside ring at the back of the rams is a steel forging. The press is fitted with 6 rams, each of 8-in. diameter by ½-in. stroke, and designed for pressures up to 1,200 pounds per square inch. The resulting load on each ram is 30 tons, or a total for the six rams of 180 tons. The

GOLDIE & McCULLOUGH CO. BANDING PRESS—TOP VIEW.

dies are circular, and are made suitable for all widths of band. The capacity of this press is about 100 per hour.

## SHELL PRODUCTION—CANADA'S RESPONSE.

THROUGH the courtesy of the Canadian Shell Committee and the managements of various engineering establishments, we have been enabled to feature what we believe to be a fairly comprehensive resumé of shrapnel shell processes, operation methods and devices, etc., practised in representative Canadian plants.

We have to thank the staff officials of the different concerns for their co-operation in accumulating the necessary data, and very especially the staff photographers of two of plants for the excellent and high-grade work they produced to our requirements.

Arrangements have been made to continue publication of a series of articles dealing with the shell industry throughout the Dominion, and in our May 6 issue will be found a comprehensive descriptive article covering Shrapnel Shell Manufacture in a Canadian Structural Engineering Works.

In the present instance the inception of the shell has been dealt with only as far back as the steel bar, but on May 27, we will go still further and trace by letter and picture the various processes from the iron ore to the Canadian completed shell.

## CO-OPERATION NOW—THEN?

IT has long been a maxim of war that one way of defeating an enemy is to prevent him from winning. This principle, in a modified form, has also been a policy of too many manufacturing institutions who apparently believe that their success is best assured by preventing the other fellow from succeeding. The call of Empire in its hour of external danger not only to soldiers but to mechanics and engineers has, for the time being, changed or obliterated entirely all such sentiment.

A number of contributory causes have brought about this very desirable result. The development of the means of attack in which vast numbers of shells are employed to conserve the lives of soldiers has raised the work of the mechanic who makes them to the highest plane. There is work of this kind for all to do and what cannot be done within the Empire must be done by others and paid for. The manufacture of shells is new to the men of our peace-loving Dominion, and manufacturers both great and small have felt the need of knowledge and experience which only co-operation can provide.

This unity of effort has taken hold and has been so complete that the Canadian output of munitions of war has already exceeded the original estimates of the country's capabilities, yet little more than half of our capacity has been reached. No complaint as to the quality of the shells has been heard and British representatives have not been sparing in favorable comments. This co-operation has not been confined directly to the making of shells, but has extended to the building of a large part of the special machinery employed which in most cases has been original in design and eminently successful in operation.

The feeling of interdependence and mutual help which has made possible the attainment of such remarkable results by hurriedly converted plants could be relied upon to accomplish more or less similar success if continued in times of peace. Hundreds of managers, superintendents and foremen have become more favorably known and disposed to each other through the shell business, and from this source alone will doubtless develop a disposition to still further intensify the spirit of industrial fellowship. Esteeming some such eventuality in the light of a by-product of the war, we might almost consider the latter in spite of its horrors, tragedies and bereavements to have been none the less "worth while."

# Our Manufacturers' Honor Roll

*Representative of Canadian manufacturers, their families and administrative staffs who have heeded the call of Empire for active service on our various overseas contingents.*

**LIEUT.-COL. A. J. OLIVER,**
General Manager, the R. McDougall Co., Galt, Ont.

CAPTAIN F. R. NEWMAN,
Sales Manager, Canadian Fairbanks-Morse Co., Toronto.

LIEUT.-COL. J. A. CURRIE,
President Imperial Steel & Wire Co., Collingwood, Ont.

PRIV. LENNARD BERTRAM,
Son of Henry Bertram (Sec.-Treas.) the John Bertram & Sons Co., Dundas, Ont.

CAPTAIN TRUMBELL WARREN,
Late President Gutta Percha & Rubber Co., Toronto, killed in action.

LIEUT.-COL. WILLIAM HENDRIE,
Vice-President the Hamilton Bridge Works, Ltd., Hamilton, Ont.

# SELECTED MARKET QUOTATIONS

**Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.**

## PIG IRON.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., April 26, 1915.**—General market conditions are rather quiet, opening of navigation improvement rather counteracted by depressing war news of casualties, etc. Steel if anything moving a little better, due to shell consumption and slight activities in railways. Prices of pig iron stationary. Metals rather active.

**Steel.**

Building sections quiet, with perhaps slight improvement. Machinery steel and merchant bars also moving more freely, due to shell manufacture. The Algoma Steel Co. has secured an order of 7,000 tons of rails from the Kansas City Southern Railway. The details of price, shipment, etc., are not yet settled, but order is officially announced. Steel companies are taking a large interest in the manufacture of shells, and the tendency is for them to co-operate with the machine shop in the matter of heat treatment, as the greatest stumbling block to shell manufacture seems to be in this feature. Tool steel companies report fair business; Armstrong-Whitworth Co., for instance, being very busy making tools.

**Pig Iron.**

Market quiet and prices unchanged.

### Machine Tools.

Much activity continues in machine tools, new and rebuilt, for the manufacture of shells. Jigs and fixtures are being put on the market by manufacturers of machine tools in great profusion, but otherwise business is very quiet. The supply business is good, and shows a developing tendency.

### Metals.

Copper has gone away up in price, due to demand for war munitions. Ammunition orders, it is believed, will continue to be placed for six months to a year after the war to fill up depleted stocks. When the war stops, the demand for copper for commercial uses will continue; hence price rise likely to be maintained.

**Tin.**—Position unchanged; enough in America to supply immediate demands. Price tendency to stiffen.

**Spelter.**—Increasing demand has sent up price.

**Lead.**—Supply plentiful for present; price easier as a consequence.

**Antimony.**—Scarcity being felt more and more, and price rising.

**Aluminum.**—Quiet, with price unchanged.

---

**Toronto, Ont., April 27, 1915.**—There has been little change in the general industrial situation during the week. In some respects the seasonable weather has had a beneficial effect on trade, but, generally speaking, business is quiet except for war orders, which are keeping a goodly number of factories busy. Many engineering plants are working at full pressure on shells, and the number engaged in this work is steadily increasing. Orders of considerable size have quite recently been distributed among firms in the West, including Vancouver and district. This practically means that every plant in Canada capable of undertaking the work is, or at least soon will be, engaged in the production of shells. In the aggregate, these orders for shells placed in Canada since the beginning of the war represent an expenditure of over eighty million dollars. This will naturally benefit the companies concerned, and help to make up for the loss of business through the ordinary channels.

A new line of action so far as Toronto is concerned, to attract new industries, has been proposed. It is suggested that a committee be appointed, consisting of representatives of the city, Harbor Commission and Board of Trade, to plan and organize a campaign to that end. In this respect Toronto is following the lead set by other cities, which have been in the majority of cases successful in their efforts.

### Steel Market.

Conditions in the steel trade do not show any material change except for the increasing demand for shell forgings and rounds for high explosive shells. This business is keeping certain departments actively employed. As regards ordinary business, the outlook is a little more hopeful, and a gradual improvement in the steel trade may be expected to take place. Prices are firm, Pittsburg prices for bars, plates and shapes having advanced to $1.20.

### Pig Iron.

Dull conditions continue in the pig iron market, and the outlook shows no signs of any immediate improvement. Foundries are quiet and operating at considerably reduced capacity.

### Machine Tools.

The situation at present as regards shell machinery is a question of supply and demand, in which the latter is greater than the former. Any suitable machine, new or second-hand, is being snapped up. Dealers are doing all they can to deal with the situation, but are seriously handicapped by slow delivery, many machine tool manufacturers having their output contracted for months ahead. Business has been rather quieter lately, but dealers report having received some nice inquiries from prospective manufacturers of shells. As the number of firms engaged in this business is increasing, there will no doubt be continued activity in machine tool circles, more especially for machines for high explosive shells, such as lathes and high duty drilling machines.

### Supplies.

There is a more active demand for supplies, business showing considerable improvement. There are no price changes of importance to note except linseed oil, which has advanced 2c, and is now quoted at 80c, with the market firm.

### Scrap Metals.

There is a fair demand all round for scrap, but more particularly for copper and brass scrap. Prices are firm, but unchanged.

### Metals.

There is a noticeable improvement in business, principally in those metals being used in the manufacture of war munitions. Copper, spelter and antimony have all advanced on heavy demand. Tin is easier, and has declined 5c. Quotations, however, are nominal.

**Copper.**—The market is very strong, and the demand for this metal for war purposes has assumed large proportions, and is still increasing. Copper has advanced 13¼c, and is now quoted at 19½c, with prospects of higher prices.

**Tin.**—The situation is unchanged, the market still being in an unsettled condition. The market for spot metal is easier, but quotations are entirely nominal at 50c per pound.

**Spelter.**—The market is excited and prices higher. There is no improvement in the situation, and supplies of spelter are still difficult to obtain. Quotations are nominal at 13c, being an advance of 1c per pound.

**Lead.**—The lead market is unchanged and dull. Quotations are unchanged at 5¾c per pound.

**Antimony.**—The heavy demand for antimony for war munitions has created a very strong market. The price of this metal is over five times what it was a year ago. Surplus stocks have already been liquidated, and the demand is increasing which points to still higher prices. English brands are scarce and prices entirely nominal. Antimony has advanced 5c, and is quoted locally at 30c per pound.

**Aluminum.**—The market is steady and quotations unchanged at 23½c per pound.

---

## EQUIPMENT FOR AUSTRALIAN RAILWAYS.

TENDER forms and specifications have been forwarded by D. H. Ross, Trade Commissioner at Melbourne, for equipment required by the Victorian Railways. These tender forms have not yet come to hand, but when received they may be inspected by interested Canadian manufacturers at the Department of Trade and Commerce, Ottawa. (Refer file No. A 1435). Particulars of the requirements, together with the date on which the tenders close at Melbourne, are briefly outlined thus:—

28,391.—Sept. 15—1-7 ton crane locomotive engine.

28,391.—Sept. 15—1 set of working drawings for crane locomotives.

The departure of mails from Vancouver and San Francisco are indicated thus:—

From Vancouver July 9, due Melbourne August 6.

From San Francisco August 3, due Melbourne August 24.

### Requirements for Queensland Railways.

Copies of indents forwarded by the Queensland Railway Department, Brisbane, to the Agent-General for Queensland in London have been furnished by D. H. Ross, Trade Commissioner at Melbourne, and are open for the inspection of Canadian manufacturers at the Department. (Refer File No. A 1435.) Particulars of the indents are outlined as follows:—

| Line No. | Particulars. |
|---|---|
| 1 | 27 copper plates. |
| 2 | Copper rod. |
| 3 | 3,000 copper-coated solid drawn steel tubes. |

# SERVICE

## To Manufacturers of Shrapnel and High Explosive Shells

¶ This is what we have to offer. Realizing the importance of accurate information on the various processes necessary in the manufacture of shrapnel and high explosive shells, we have accumulated expert information on the best tools for the purpose and have created a Department of our business, devoted to the investigation of the most up-to-date Labor-Saving Methods.

¶ **We offer you this service without obligation on your part.** Our recommendations have proven valuable to others and every day we are adding important information to what we have already acquired. We are in touch with the actual problems that come up from day to day in the manufacture of shrapnel and high explosives, **and we can start you off right and save you money by helping to avoid the expensive initial mistakes which are due to inexperience.**

¶ We have equipped over twenty-five of the largest manufacturers of Projectiles in Canada, and in the following pages we illustrate a few of the tools that have made good. They are the highest grade manufactured and the product of some of the leading toolmakers in the world. They have the fullest endorsement of this organization.

*"Success Lies in Mutual Service."*

# High Speed Hammers for High Speed Work

An elastic blow is obtained by two heavy rubber bumpers in the rear of the machine and a bumper between the hammer head and helve. The hickory helve absorbs the shock of the rebound. The drive is side friction and permits any range of speed up to that recommended. It is thoroughly understood that a friction drive is far superior to a clutch drive as the operator can strike a very sensitive or a heavy blow at will.

The great features of this machine are: Economy in floor space, elimination of weight and a **guaranteed** saving of from 15 to 20% on any class of work. The life of the machine is practically indefinite as phosphor-bronze bushings are used throughout.

Remember, there is no riveting too intricate for us, no riveting which our machine cannot accomplish.

Where others fail we excel. We shall be glad to receive a few of your parts and return them to you properly riveted.

**The High Speed Hammer Book** gives a comprehensive description of a profitable hammer —the kind you want in your shop.

Scleroscope at Work.

## For Testing Shrapnel Parts

# THE SCLEROSCOPE

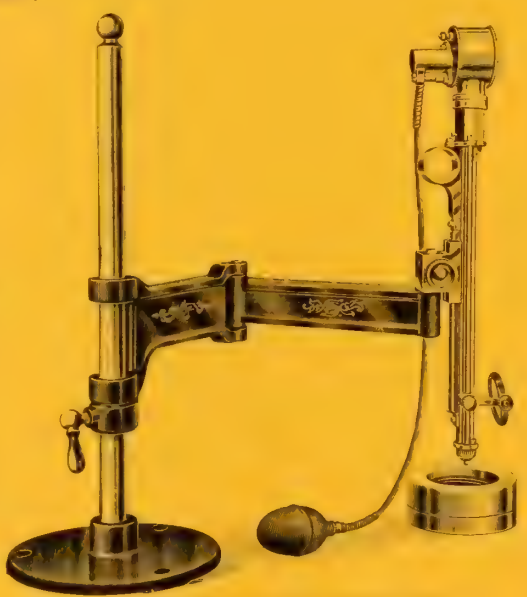
## Is Used Universally

The British Government specifications are that a shrapnel shell shall strike between 43 and 50 after heat treatment. Shells falling below this are rejected.

The scleroscope is depended upon to give accurate results. It does this or it would not be specified by the British Government.

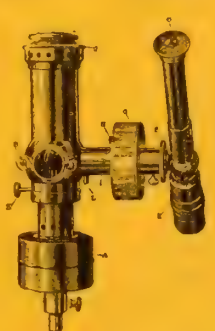
The scleroscope has been adopted by the various governments for testing shells and projectiles because it is fast as well as dependable. If you want to *know* the physical qualities of steel, and other metals, use it.

*Booklet on request.*



The Scleroscope on swing arm.

# FOR HEAT INDICATION USE The PYROSCOPE



Is the common sense heat measuring instrument that makes straight for results without fuss. Costs least of all; burns simple kerosene; never varies. It is the one available trusty in the grimy hands of furnace men, hardeners, carburizors. It is a pet in the laboratory, and is also being universally adopted by colleges for demonstration purposes owing to the correctness of the principle utilized. Our best customers are those who have tried all other means of heat measuring.

Send for our free circular P. and list of users in the United States.

Pyroscope in Use.

**THE FIRST REQUIREMENT IN SHELL GRINDING IS RIGIDITY**

# Study the "LANDIS" and you will be impressed with its massive construction

The heavy walls of the rectangular bed are thoroughly reinforced by heavy webbing. The head and footstock are heavy and are rigidly clamped to the wide, rectangular bearing surfaces of the wide, heavy table, which in turn is solidly secured to the main column of the machine. This, like the wheel base, is designed to eliminate overhang.

The grinding wheel base is extremely massive and, including the bearing housings, is a one-piece solid casting and, like the wheel carriage, is supported by wide ways set the extreme distance apart.

The pull of the long, wide, direct-drive grinding wheel belt is directly back and down from the spindle, which tends to secure the carriage and base with the bed of the machine.

The wheel spindle is directly above or between the wide carriage ways, insuring a solid foundation. The large wheel spindle has long journals running in heavy bronze bearings, which are self-compensating for heat expansion, and which can be easily adjusted, for wear, by the graduated collar on the end of the spindle. This prevents sticking and overheating and eliminates dismantling or scraping, which is common to the ordinary type of bearings.

Hess-Bright Ball Bearings are used on high-speed bearings, thus reducing the power required.

The surfaces upon which alignments are dependent are chilled, insuring their permanency. Special work-holding fixtures are furnished with these machines which automatically adjust themselves and eliminate centering of the shrapnel.

A special truing fixture for forming the wheels to the various contours of the finished shrapnel can be furnished.

SEE NEXT PAGE FOR FURTHER PARTICULARS.

# Every feature of the "LANDIS" stands for Accuracy, Rigidity and Rapidity

The quickly operated footstock spindle saves time in changing the work.

The travel of the wheel carriage can be quickly and easily set from the maximum to the minimum movement, as desired, or removed entirely.

Interchangeable wheel centres permit of rapid change of wheels. Single lever starts or stops work and traverse simultaneously. Variety of speeds can be quickly had by shifting the work speed lever with the left hand or the traverse speed lever with the right while machine is in operation.

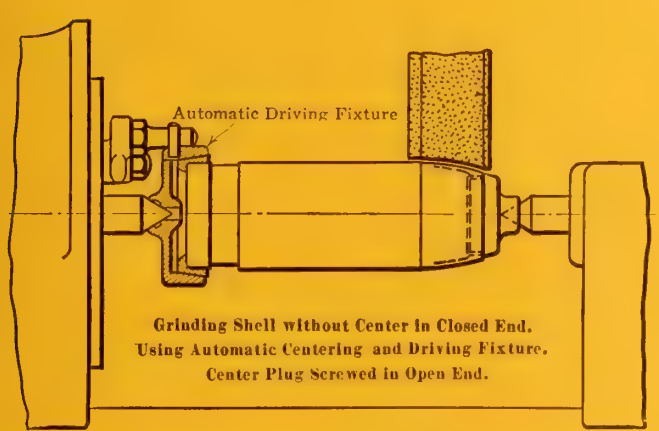
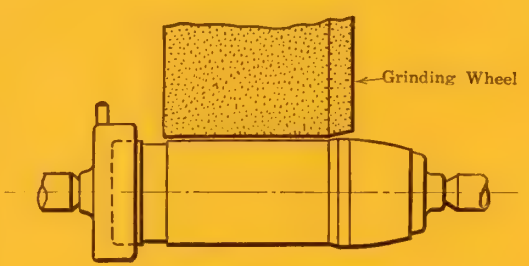
Grinding Relief and Taper with Wide Wheel.



Grinding Shell without Center in Closed End. Using Automatic Centering and Driving Fixture. Center Plug Screwed in Open End.



Grinding Relief and Taper with Wide Wheel.

INSTRUCTIONS FOR GRINDING BODY OF 15 and 18 POUND SHRAPNEL SHELLS ON 10 x 24 LANDIS PLAIN GRINDING MACHINE.

Specially equipped for the work.
Rotate Shell 55 r.p.m.
Speed of wheel, 5800-6000 surface feet per minute.
Diameter of wheel for grinding body of shell, 18", 6" face.
Wheel used, 16 j. Aloxite.
H.P. required, 15.
One man to operate machine.
One boy to screw centre cap in open end of shell, and place dog on closed end of shell.

INSTRUCTIONS FOR GRINDING NOSE OF SHELL, USING 10 x 24 LANDIS PLAIN GRINDING MACHINE EQUIPPED WITH 18" x 3" FACED WHEEL.

Special formed device for forming the wheel to proper radius for nose of shell; rotating speed for the work, 55 r.pm.; speed of wheel, 5600-6000 surface feet per minute.

H.P. required, 12.

Wheel will grind 20 shells, without redressing.

With above sized machine and equipment, we can grind, removing 1-32", on each operation of nose and body, 40 shells per hour.

Geometric Collapsing Tap Arranged for Plug Tapping.

## "Geometric Threading Tools Have Become Indispensable in Our Work"

That is what our customers say.

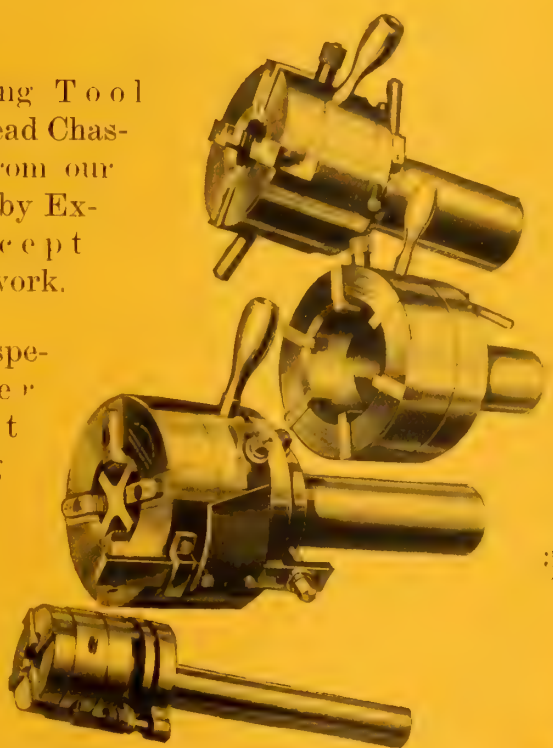
We want you to find this true, also.

We will not be satisfied, and you certainly will not be, until you do.

The Geometric Die Heads and Collapsing Taps here shown are at work on all makes of Screw Machines, cutting the screw threads on shrapnel, and on all classes of thread-cutting where accurate and rapid work is sought.

Every Thread-Cutting Tool and every set of Thread Chasers that goes out from our factory is inspected by Experts, who will accept nothing but perfect work.

Standard threads, special threads, taper threads, short threads, long threads — if it is a Screw Thread our Experts can fit you out.



We are furnishing Self-Opening Die Heads for cutting 1-16-inch diameter and up to the largest diameter required. Any length.

Collapsing Taps for tapping any diameter above 3/4-inch.

Our plant is running day and night to meet the demands of Shell Manufacturers. Your order will receive the same good attention.

Do not spend time puzzling over what equipment will be necessary. Send us details of your thread-cutting operations—the diameters, pitch, length and form of thread, the kind of machine used—and we will tell you what equipment will be necessary.

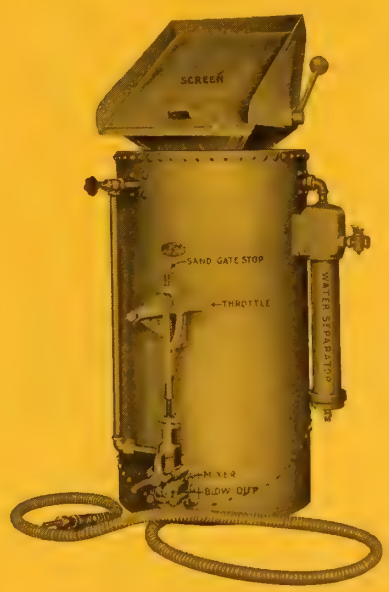
# CURTIS

## Labor-Saving Equipment

**Have proven efficient and safe during years of service in thousands of foundry and manufacturing plants the world over.**

**CURTIS AIR HOISTS**:—Are ideal for hoisting service on crane, elevator or overhead trolley or for drawing patterns, setting cores, pouring metal—ordinary or delicate handling.



**CURTIS AIR COMPRESSORS**:—Are built for service, not price competition. Many have been furnishing cheap air for 15 years and are still at it—some are doing 24 hours' hard service. In sizes 3 to 300 cubic feet capacity.

**CURTIS CRANES**:—There are no safer or easier running cranes made. They are figured with a factor of safety of five, have long wheel base, large diameter wheels and Hyatt Flexible Roller Bearings throughout.

**CURTIS TROLLEYS**:—A ton load on a **CURTIS** Trolley can be moved with a push of less than 50 pounds. "Nuff sed."

**CURTIS SAND BLASTS**:—Have maximum abrasive action and embody many features that save time and labor not included in the design of other makes. Yes, they are used by the French Government for cleaning scale from shrapnel cases.

# THREAD MILLING MACHINES

## FOR HIGH EXPLOSIVE SHELLS

**Designed for the purpose of milling the thread in the base and nose of high explosive shells.**

Shell is placed inside a revolving spindle and is self-centering. A perfect thread is produced in base of shell in approximately $2\frac{1}{2}$ minutes.

Milling Cutter is made from best high-speed steel, by Brown & Sharpe, from special design by Holden-Morgan Co., and is so shaped that it can be sharpened without changing the form. Cutter is designed to mill the top of thread as well as the depth.

Machines are fully equipped for work, including oil pump. Fitted with automatic stop motion, which stops machine when thread is completed. One operator can run several machines. Eliminates all risk of having shells rejected on account of thread being stripped, as is liable to be the case when tapped by the old method.

## RUSSIAN SHRAPNEL AND HOWITZER SHELL ORDER.

THE following statement taken from the N. Y. Journal of Commerce, deals with the placing of a large part of the 5,000,000 shrapnel and howitzer shell contract valued at some $83,000,000, which was recently secured by the Canadian Car & Foundry Co., Montreal, from the Russian Government. The average cost per shell amounts to some $17.85.

It is learned that sub-contracts on the Russian shrapnel and howitzer shell order to the extent of $21,724,400 have already been awarded or sublet by the Canadian Car & Foundry Co. to a total of 37 American steel and powder concerns located in all parts of the country, and that four other contracts, totaling in value $30,104.330, are still pending before prospective subcontractors, with every prospect of being closed at any time. The remaining portion will be filled by the original contractors and other Canadian engineering establishments.

### Sub-contracts Awarded.

| Participating Company. | Value.. |
|---|---|
| Hydraulic Pressed Steel Co., Cleveland, Ohio | $ 475,000 |
| American Rolling Mill Co., Middletown, Ohio | 930,000 |

| Total | $21,724,400 |

### Pending.

| | |
|---|---|
| American Locomotive Co. | $10,000,000 |
| Pressed Steel Car Co. | 10,000,000 |
| U. S. Cartridge Co. | 10,000,000 |
| Dayton Manufacturing Co. | 104,330 |
| Total | $30,104,330 |

*Finishing only furnish no parts.
†Additional.

It is learned that according to signed statements submitted by the officials of the Canadian Car & Foundry Co., that their total profits on the whole order is to be about 25 per cent. of the contract price, or approximately $20,000,000.

### Large Cash Advances Arranged.

The Canadian Car & Foundry Co., in taking over the contract from the Russian Government also assumed an option on all future orders of that Government for war materials on this side of the world, and the privilege to take up the order itself. Under the terms of the agreement, the Russian Government is to make advances to the Canadian Company in cash, from time to time, of sums ranging all the way from $750,000 to as high as $4,000,000, and in one or two instances, may receive as much as $10,000,000, which funds are to be used for the extension of the company's plants.

It is stipulated that all of the cash advances made by the Russian Government must be preserved in a separate banking account by the Canadian concern, and in the event of an abrogation of the contract, the right to do which is reserved in the event of the war terminating before the contract can be filled, all such funds which have been unexpended in building new additions to existing plants, will have to be returned.

### Dayton (O.) Co. to Make Time Fuses.

As may be seen from the list given, the most important contract sub-let by the Canadian Car & Foundry Co. thus far is that given to the Recording & Computing Machine Co., Dayton, Ohio, amounting in value to $6,000,000. This contract calls for the delivery of the major portion of the time fuses which are to be used on the shells. The second important contract sub-let thus far is that given out to the Michigan Brass & Copper Co. of Detroit, amounting to $2,000,000; the third largest going to the Federal Pressed Steel Co. of Milwaukee, Wis., and the fourth to the Barney & Smith Car Co., Dayton, Ohio.

Reports that the American Locomotive Company received an order from the Russian Government amounting to $40,000,000, which were the cause of speculative activities in the stock market recently, are now definitely discredited. The Locomotive Company is a bidder for a sub-contract from the Russian Government, through the Canadian Car & Foundry Co. for shrapnel shells to the extent of only $10,000,000, and the negotiations on this matter have not yet been closed, although there are prospects that they will be shortly.

The Pressed Steel Car Co., the United States Cartridge Co. and the American Locomotive Co. will probably participate to an equal extent in the distribution of the Russian shrapnel order. Each of those three concerns, it is now positively known, have contracts worth $10,000,000 each, pending in connection with the original order from Russia, and the Dayton Mfg. Co. of Dayton, O., of which John Kirby, Jr., former president of the National Association of Manufacturers, is the head, is figuring on an additional sub-contract amounting to $104,330, having already obtained awards from the same source in Canada, to the extent of over $800,000.

### Provision Against Litigation.

An interesting phase of the contract terms arranged by the Russian Government with the Canadian Car & Foundry Co. is that it is provided in the event of any litigation arising out of the arrangements, the prevailing phraseology shall be that contained in the original draft prepared in Russian, and not that contained in the translated copies. Thus it is assured that any litigation which may arise out of the large order will have to be taken to Russia for settlement and will be settled according to the laws of

that country and the matter of contracts.

The Canadian Car & Foundry Co. is strongly protected against minor causes for possible abrogation of the contract, however, by the definition of delivery terms. It is stipulated, for example, that placing of finished products in warehouse alongside of tracks in the Toronto yards, will constitute delivery, and the Russian Government must arrange for the transportation service on the railroads in the Dominion. In carrying out the agreements reached on the sublet contract, the Canadian company, it is understood, is to deliver to the various plants in this country the shrapnel parts ready to be machined and assembled.

It develops that at least three large steel manufacturing corporations in the Middle West, who were offered portions of the contract, turned down the business, with the statement that they did not care to participate in the manufacture of death-dealing instruments of war.

**$15,000,000 Field Gun Contract Secured.**

From authentic sources it is learned that the Russian Government has very recently placed a contract calling for the manufacture and delivery of miscellaneous artillery field and machine guns, by American mills, to the value of $15,000,000. The contract has been placed with a contracting broker or middleman, who is now handling the order and is understood to have been practically closed out already by means of sub-contracts.

## ZINC AND COPPER TREATMENT IN CANADA.

AN investigation which has an important bearing on the manufacture of ammunition has just been completed by Dr. Alfred Stansfield, professor of metallurgy at McGill University; Hon.-Col. David Carnegie, of the Shell Committee in Canada, and Dr. A. W. G. Wilson, of the Mines Branch, Ottawa. These gentlemen have just returned from a three-weeks' tour of the West, where the investigation was conducted with a view to the establishment in Canada of a copper refinery and zinc reduction works. At present all the copper mined in this country has to be sent to the States to be refined, and similarly the zinc ores have to go over the border to be smelted. Both these metals are used in the manufacture of shells. If the refining and smelting can be done within the Dominion, it will be a step of great importance, not only from the military standpoint, but also from the general commercial point of view.

**The Machine Shops Safety Association** has been incorporated at Toronto, Ont., to promote and carry on the work of prevention of accidents in machine shops, etc., at Toronto, Ont. Incorporators: G. B. Meadows, S. T. Sheppard and H. J. Daly, all of Toronto, Ont.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

# INDUSTRIAL AND CONSTRUCTION NEWS

**Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.**

## Engineering

**Copper Cliff, Ont.**—The Canadian Copper Co. will immediately commence work on the construction of a new blast furnace.

**Deer Lake, Ont.**—The air compressor plant at the Cordova Gold mine at this place was wrecked recently. The damage is estimated at $30,000.

**Camrose, Alta.**—The town contemplates purchasing a steam condenser to connect up with a 75-h.p. engine; also an induction motor for a 2,400 volt 60-cycle current.

**Owen Sound, Ont.**—It is reported that an industry, manufacturing resilient automobile wheels is about to be established and that a company is being formed in connection with it.

**Stratford, Ont.**—The Hydro-Electric engineers have been requested to prepare for the local commission the necessary plans and specifications for the proposed new standpipe and gasoline plant. The outlay for the new machines will be between $45,000 and $50,000.

**New Westminster, B.C.**—A large order for shells will be distributed among those machine shops in this district able to undertake the work. The Vancouver Engineering Works will be the central depot for the receipt and distribution of the forged blanks as they come out from the East. That firm will install considerable auxiliary plant for the supplementary operations other than the actual machining, which is all that the other plants are required to do. These supplementary operations include pressing on the copper rings or bands, inserting the plugs, etc., and will require the installation of hydraulic presses, ovens, and sand blasts, at considerable expense.

## Electrical

**St. Catharines, Ont.**—A proposal is under consideration for an underground lighting system for Yates street.

**Winnipeg, Man.**—A large addition will be made to the King Street substation involving an expenditure of $20,000.

**Markham Village, Ont.**—Plans are being prepared by the Village Council to make an addition to the municipality's lighting system.

**Toronto, Ont.**—The Board of Education will reconsider the tenders submitted for electric motors for the new Technical School.

**Cobalt, Ont.**—The town council passed a unanimous vote asking the Hydro-electric Commission to send its engineers to investigate the power situation and rates in the camp.

## Municipal

**Richmond, B.C.**—The council is contemplating extensions to the waterworks system.

**Halifax, N.S.**—The City Council will call tenders for valves. F. W. W. Doane is city engineer.

**Walkerton, Ont.**—The ratepayers have carried a by-law to provide $5,000 for extensions to the waterworks system.

**New Liskeard, Ont.**—A by-law will be voted on to sanction repairs to the water pipe over the River Wabi, to cost $1,000.

**Welland, Ont.**—The Board of Trade has approved of the proposal to submit the library by-law to the electors at an early date.

**Stratford, Ont.**—The first reading has been given to the by-law to grant concessions to the Bartlett Automobile Co. of Toronto.

**Brantford, Ont.**—A movement has been started to cancel the franchise of the Brantford Gas Co. on account of the quality of gas being distributed.

**Toronto Wants Industries.**—Mayor Church is trying to get the city, the Harbor Board and the Board of Trade to combine to secure more manufacturing industries for Toronto.

**Toronto, Ont.**—The contract for the Island incinerator has been let to the Toms Contracting Co., the tender being $11,500. It will be erected of buff brick and roofed with Spanish tiling, and will have a capacity of 20 tons per day.

**Westmount, Que.**—The City Council at its meeting on April 20, decided to appropriate $49,486 for new paving works, etc. It was announced at the meeting that cables for the extension of the underground lighting system will cost $14,000, the new lamps $4,375, and 100 cast iron standards for the cross streets, $2,450.

**Berlin, Ont.**—The Provincial Board of Health has reported that the sewage disposal plant is inadequate and that it should be enlarged. Mayor Hett, Alderman Hessaneur and Huehnergard and Engineer Johnston have been appointed as a committee to secure necessary information before making further expenditures on the present plant.

**Toronto, Ont.**—The Provincial Government has made the following appropriations for road building in various districts: Rainy River district, $25,000; Kenora, $25,000; Port Arthur, $40,000; Fort Killiam, $50,000; Sault Ste. Marie, $50,000; Sudbury, $40,000; North Bay, $50,000; Nipissing, $35,000; Haileybury and South Lorrain, $55,000; other specially designated roads, $102,000.

## General Industrial

**Amherstburg, Ont.**—The Kemp Furniture Co. will probably extend their factory.

**Milton, Ont.**—A textile company which will be incorporated shortly, proposes to establish a factory here.

**Toronto, Ont.**—Fire on April 25 did $40,000 damage to the building and stock of the Canadian Machine Telephone Co.

**New Westminster, B.C.**—G. W. Laidlaw has taken over the old nail works at Queensboro, and will equip a plant for making bright steel shingle ties.

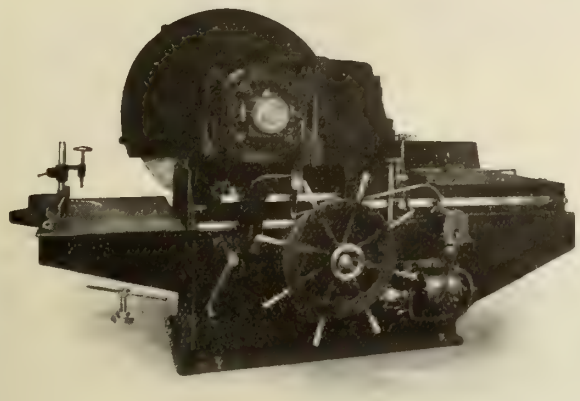
**Owen Sound, Ont.**—J. H. Tromanhauser & Co., Temple Building, Toronto, are preparing plans for the proposed new 500,000-bushel elevator at this place.

**Lambeth, Ont.**—The cement block factory, owned by W. T. Robinson and W. Kelly, was completely destroyed by fire recently. The damage was estimated at about $3,500. The building and its contents were well insured.

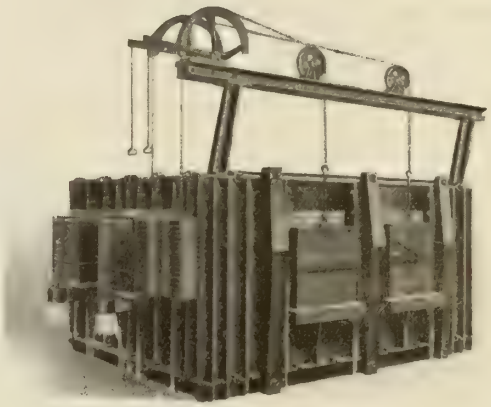
## Building Notes

**Calgary, Alta.**—Plans have been completed by the architect, Leo Dowler, for a new armory to be erected at Mewata Park. Tenders for the general contract will be received until May 25.

# Ryerson Projectile Equipment

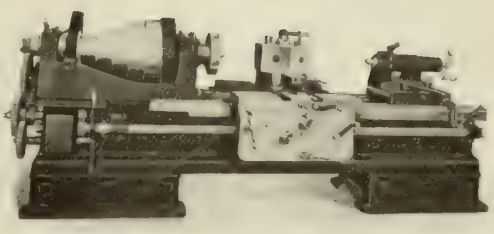


Ryerson High Speed Friction Saw.
Will cut 3-inch shell stock in 15 seconds.

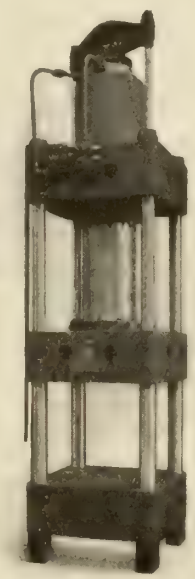


5 ft. x 8 ft. Billet Furnace.

We are prepared to furnish complete equipment for rapid cutting of shell stock and drawing of shrapnel as well as turning and machining projectiles.



24 inch x 12 ft. Heavy Duty Engine Lathe with turret on carriage.



350-ton Shrapnel Drawing Press.

We have already equipped a number of shops with our complete unit for producing 1,000 to 1,200 shells per day, consisting of Ryerson High Speed Friction Saws, with patented stock rotating device, Oil Burning Furnaces for heating and annealing, Hydraulic Piercing and Finishing, Nosing and Copper Banding Presses, Turret Lathes and Automatic Machinery.

Our Engineering Department is completely equipped to consult with you about your requirements and is prepared to give you expert advice on equipment that will produce the best results in the shortest time.

**Calgary, Alta.**—The School Board has recommended building an addition to the Collegiate Institute to cost over $200,000.

**Toronto, Ont.**—The new C. P. R. station at North Toronto, will cost about $800,000. Darling & Pearson, of Toronto, are the architects.

**Ingersoll, Ont.**—Nagle & Mills, of this town, have been awarded the contract for the erection of an addition to the factory of the Borden Milk Co., at Tillsonburg.

## Contracts Awarded

**The Toronto Structural Steel Co.**, Atlantic Avenue, has received a contract for shells.

**The Galt Foundry Co.**, of Galt, Ont., has been awarded a contract for castings by the Galt town council.

**Woodstock, Ont.**—The Standard Tube and Fence Co. has received a large order for woven wire fence from the C.P.R.

**The Hamilton Bridge Works**, Hamilton, Ont., has been awarded the contract for a steel bridge over the Welland Canal at Thorold, Ont.

**Toronto, Ont.** — The City Council awarded the contract for four water tube boilers for the main pumping station to the Canadian Allis-Chalmers Co.

**Canadian Allis-Chalmers, Ltd.**, Toronto, will supply the ornamental ironwork for the new bank building at Windsor, Ont., for the Canadian Bank of Commerce.

## Tenders

**Prince Albert, Sask.**—Tenders will be received until Monday, May 3, 1915, for furnishing lubricating oils, required at the city power house, for one year. Specifications and particulars can be obtained on application at the City Electrical Superintendent's Office.

**Ottawa, Ont.**—Tenders will be received up to May 7 for works for protecting the Government dam at Valleyfield. Plans and specifications may be seen at the office of the chief engineer of the Department of Railways and Canals, Ottawa, and at the office of the superintending engineer, Quebec Canals, Montreal, Que.

**Ottawa, Ont.** —Tenders will be received by the secretary of the Water Works Committee, Ottawa, up till Wednesday, May 12, 1915, for the supply and erection of one electrically-operated pumping unit. Specifications and full particulars may be obtained on application to the city engineer's office, city hall, Ottawa.

**Ottawa, Ont.**—Tenders will be received until Wednesday, May 5, 1915, for the supplying, manufacturing and erecting wagon and cylindrical valves for certain locks on the Trent Canal. Plans, specifications and forms of tender can be obtained by application to the chief engineer, Department of Railways and Canals, Ottawa, or to superintending engineer of the Trent Canal, Peterborough, Ont.

**Ottawa, Ont.** — Tenders will be received until Wednesday, May 5, 1915, for the manufacture and delivery of operating machines, anchorage fittings and pivots for locks, and gains for emergency steel stoplog bridges for the Trent Canal. Plans, specifications and forms of tender can be obtained by application to the chief engineer, Department of Railways and Canals, Ottawa, or to superintending engineer of the Trent Canal, Peterborough, Ont.

## Personal

**Capt. Paul R. Hanson**, manager of the Dunlop Tyre Co., Montreal, was wounded at Ypres.

**Charles E. Parry**, town engineer of Fort Frances, Ont., is serving with the Third Canadian Contingent as a lieutenant in the 52nd Battalion.

**H. A. Bayfield** has been appointed principal assistant engineer at Fort Nelson, the terminus of the Hudson Bay Railway.

**John Christopher**, of Christopher Bros.' sash and door factory, Ingersoll, Ont., died at that town on April 23, aged 89 years.

**Major R. H. Jamieson**, vice-president of R. C. Jamieson & Co., Montreal, was wounded during the action at Ypres recently.

**Thomas Strachan**, assistant engineer on the Trent Valley Canal construction, was accidentally drowned near Port Severn on April 19.

**Sir Adam Beck** has left for France on an important mission in connection with the operations of the British forces. He will be acting for the Dominion Militia Department.

**George Bradshaw**, safety engineer, Grand Trunk Railway System and Grand Trunk Pacific Railway, located his office at the Union Station, Toronto, on April 26.

**C. W. Van Buren** has been appointed general master car builder by C. W. Woodhouse, chief mechanical engineer of the C.P.R., in place of R. W. Burnett, who has resigned.

**J. C. Baukat**, of Toronto, who has been connected with the hydro radial scheme for some time, has been appointed acting manager of the London and Port Stanley Railway.

**Engineer Somerset**, of Toronto, who had been selected to organize the staff of the London & Port Stanley Railway, and operate it until he had been finally confirmed by the local commission as manager, died in Toronto recently.

**John A. Culverwell**, hydraulic and electrical engineer, died in Toronto on April 21, aged 48. Mr. Culverwell was born at West Flamboro, Ont., and was for some years connected with power development in the Trent Valley district.

**James F. Markey**, master mechanic in Toronto for the Grand Trunk Railway, died suddenly at his home, 215 Roxton Road, on April 23, after a few weeks' illness. Mr. Markey had been in the employ of the G. T. R. for twenty-five years, rising from the position of locomotive engineer to the post which he held at the time of his death.

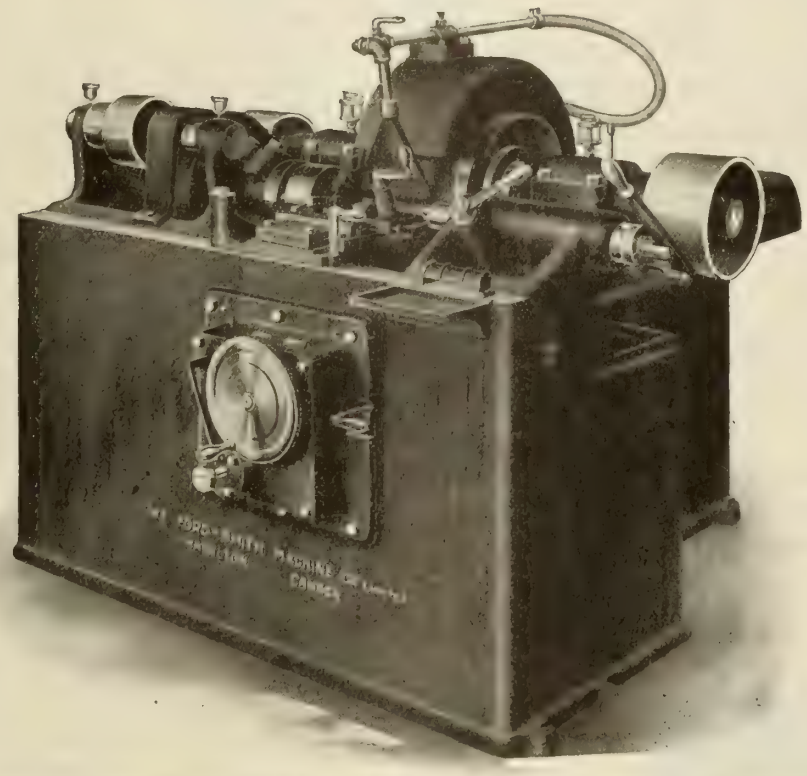
**Conrad Just**, who was lately Canadian Trade Commissioner at Hamburg, and was detained there for six months, and recently exchanged for a German representative in South Africa, has left for Russia to study trade conditions there on behalf of the Canadian Government. Mr. Just expects to remain in Russia for about four months.

**H. H. Vaughan**, who has been in charge of the locomotive and car department of the Canadian Pacific Railway, has resigned in order to devote himself to the management of the Montreal Ammunition Co., of which he is president. He will be succeeded as chief mechanical engineer of the Canadian Pacific System, by William E. Woodhouse, Montreal, superintendent of Motive Power and Car departments, Eastern Lines. Mr. Woodhouse entered the service of the C. P. R. in 1891, and has been in the mechanical department ever since. He will be succeeded as superintendent of Motive Power on Eastern Lines by D. T. Main, who joined the C. P. R. service in 1904. Mr. Main has been in charge of the Mechanical Department at Toronto. Before going to Toronto he was in charge at Vancouver.

## Trade Gossip

**The A. B. See Electric Elevator Co.**, Montreal, has been awarded a contract for elevators at the Bank of Toronto building, St. James and McGill streets, Montreal.

# The Ford-Smith One Operation Shrapnel Shell Grinder



A Powerful Extra Heavy Grinder for finishing Shrapnel and General "Wide Wheel" Grinding.

This machine, using an Abrasive Wheel 20" dia. x $8\frac{1}{4}$" face, grinds both body of shell and nose as quickly as the lighter type general purpose precision grinders can grind the body alone.

Depending on the amount of stock left for finishing, we grind from fifteen to sixty-five shells without re-trueing the wheel.

**POWER**—Two 6" Belts drive the Emery Wheel Spindle, one 4" Belt with one to four gearing drives the shell.

**RIGIDITY**—Machine weighs 7,000 pounds of carefully distributed metal, with an absolute absence of vibration.

**CONTROL**—Necessary levers, etc., all in front, the wheel trueing device swings into position when required.

**ABRASIVE WHEEL** is held solidly between two $3\frac{3}{4}$" bearings, on Safety Flanges, and six to 10,000 shells can be ground before renewing.

We have fifteen of these machines in operation, doing from one hundred and forty to two hundred shells per ten hours, according to amount of stock left on the shell.

It will pay you to investigate this machine in comparison with your lathe work, or other grinder performances.

**Regina, Sask.** — The Saskatchewan Broom Mfg., Ltd., has been incorporated with a capital of $20,000. It is proposed to enlarge the plant. C. A. Mahin is managing director.

**The Richardson-Phenix Co.**, Milwaukee, Wis., announces that it has purchased the patents, good-will and manufacturing rights of the Osborne "No Kut" valve, and that it is now carrying a complete line of the various size valves in stock.

**The Kerr Turbine Co.**, of which M. E. Storey, Kent Building, Toronto, is Ontario representative, has closed an order with the National Steel Car Co., Hamilton, Ont., for a 20 h.p. Kerr turbine, to be operated condensing, on a Westinghouse condenser outfit, in connection with steam-driven compressors.

**The Woodworkers' Accident Prevention Association** has been incorporated at Toronto, Ont., to promote and carry on the work of prevention of accidents in the woodworking industry, etc., at Toronto, Ont. Incorporators: W. B. Tindall, W. Cameron Laidlaw and W. C. Irvin, all of Toronto, Ont.

**North Bay, Ont.**—At a meeting of the various boards of trade of Temiskaming and Upper Ontario, Hon. Frank Cochrane was asked to have engineers investigate the feasibility of improving the French River at a reasonable cost, and to have the balance of the $500,000 to be expended in the interest of this undertaking as soon as possible.

**Toronto, Ont.**—Tenders will be received up to Tuesday, May 11th, 1915, for the supply and installation of one sludge pump and motor for the main sewage disposal works, Toronto. Tenders must be addressed to the chairman Board of Control, City Hall. Specifications and forms of tender may be obtained at the Works Department, City Hall.

**Treating Molybdenite Ores.**—A plant for treating molybdenite ores has been established at Sydney, N.S., and a first shipment of 100 tons of metal is to be sent to England in June. The principal supplies of molybdenum have heretofore come from German sources and the cutting-off of these has caused considerable embarrassment in England. The metal is used in the manufacture of special steels.

**Saddle and Harness Orders.**—C. F. Todd of Markham Village, Ont., has received his third war order, this time amounting to $5,000, from the Canadian Government, for saddles and harness. Mr. Todd has leased the old storehouse at the woolen mills, in order to get room to finish the contract on time. All Markham industries are sharing in a greater or less degree in the increased activity due to the war.

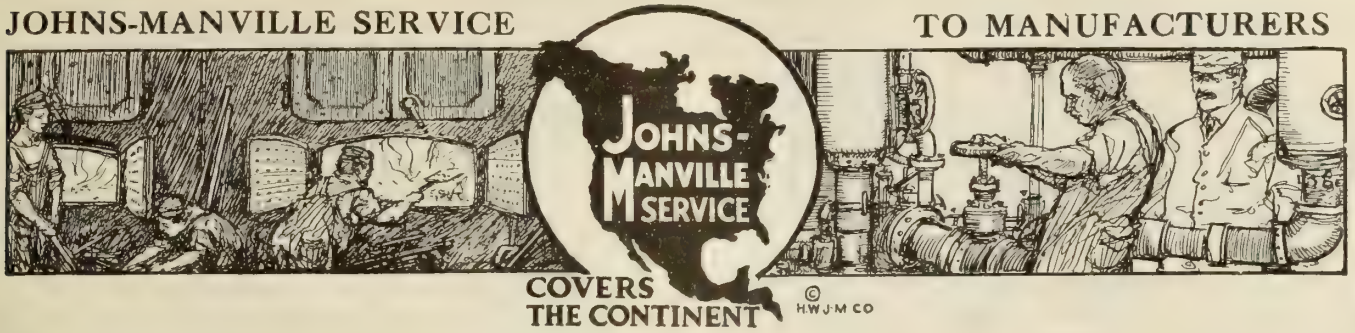
**Shells From Winnipeg.**—All arrangements were completed on April 23, for the manufacture of shells in Winnipeg. A meeting of the Western Steel Committee was held in the Fort Garry Hotel at which were present ex-Mayor Deacon, chairman; R. Preston, representing the C. P. R.; E. J. Barrett, Vulcan Iron Works; A. H. Eager, C. N. R.; D. Billingham, G. T. P. Col. Carnegie, who had inspected the works in Winnipeg, explained certain matters to the members.

**Shell Contracts.**—Orders for shells to the amount of half a million dollars have been placed with the Canadian Brakeshoe Co., Ltd., and Mackinnon, Holmes Co., Limited, Sherbrooke, Quebec, of this city by the shell committee. A third local concern is negotiating with the committee for an order which will amount to over six hundred and fifty thousand dollars. The first two firms named will start in at once to instal the necessary equipment and prepare to carry out the contract.

**Boving Co. in Liquidation.**—An order has been made at Osgoode Hall by Mr. Justice Hodgins, placing Boving & Co., of Canada, Ltd., in liquidation. The company was incorporated with head office at Toronto in June, 1913, and has a nominal share capital of $1,000,000, of which it is said $148,000 preferred and 356,000 common stock was subscribed and paid up. H. Malcolm Robinson was named interim liquidator, with a reference to the master in ordinary. Boving & Co., Ltd., of London, Eng., are the petitioning creditors, with a claim of $41,000. The Canadian company assigned on April 15 for the benefit of its creditors.

**Electric Wiring Rules.**—The Hydro-Electric Power Commission of Ontario has issued a warning that it is against the laws of the province to install electric wiring in any building or in connection with any building unless the same complies with the requirements of the rules and regulations of the commission. Permits for the installation must be secured before work is commenced. All contractors working in the city must secure permits from the Electrical Inspection Department, City Hall, while out-of-town applicants can obtain permits from the nearest authorized electrical inspector. It is also against the provincial laws for any electrical supply company to make connections or to supply current to any building without a proper certificate issued by the electrical inspector in the district in which the service is situated.

JOHNS-MANVILLE SERVICE TO MANUFACTURERS



## As owners and managers of plants you will perhaps be interested in the business policy of the H. W. Johns-Manville Co.—a policy that has derived the term Johns-Manville Service.

This policy may be stated as the voluntary acceptance of entire responsibility for the performance of every J-M product.

This is more than a guarantee that assures one renewal. It is more than the marketing of products of proven merit.

This policy argues complete confidence on our part in J-M products and it invites complete confidence on your part in these materials.

In addition to all that has been stated, let us add that not only does Johns-Manville Service relieve the buyer from all risk, but it offers every help on your work that its national organization can so ably give.

## J-M Asbestos Roofings put an end to your Roofing Expense

These roofings are non-corrosive as well as weather-proof and time-proof and will last for a generation.

Some in use for twenty to thirty years—and still good!

Contain no organic material—made only of Asbestos Fibre and Trinidad Lake Asphalt. Never need painting. Are fire retardant almost to a fire-proof degree and non-conducting.

Furnished in "Built-up" type for flat roofs and in "Prepared" type for sloping roofs.

J-M Asbestos Built-up Roofing has a smooth surface and is very much lighter than tar-and-gravel.

Your own men can easily lay J-M Asbestos Ready Roofing with J-M Vise-Grip Roofing Cleats and make a perfect job.

Register your J-M Roof with us and we will see that it gives you full service under J-M Roofing Responsibility. Ask about this.

## There's a difference in buying Pipe Coverings F.O.B. your factory and F.O.B. your Steam Pipes

The difference usually shows in the efficiency of your plant, because a good covering if carelessly or unskillfully applied is often rendered inefficient.

Johns-Manville pipe-covering service handles the whole job as a unit. It will co-operate with you through its skilled specialists in the selection of proper pipe covering for your plant conditions; it will sell you good coverings and apply them as they should be applied.

*It doesn't matter where you are, you can have this service at your bidding.*

**Ambulance for Red Cross.**—A military motor ambulance has been presented to the Shorncliffe Hospital by the McLaughlin Carriage Co., of Oshawa, Ont., on April 23. Noel Marshall received the car on behalf of the hospital. G. W. McLaughlin, on behalf of the company, made the presentation, and in a brief speech referred to the many sacrifices which Canada was making for the Empire's cause. Mrs. Edmund Bristol and Eric Armour received the gift on behalf of their brother, Lieut.-Col. Surgeon Donald Armour, who is in charge of the hospital.

**The Dominion Bridge Co.**, of Lachine, Que., and its recently organized subsidiary, the Montreal Ammunition Co. is understood to have on hand orders for shells from the British Government for approximately $15,000,000, and is about to open a London office to take care of additional business offerings. The calibre of the shells is much higher than those recently ordered by the Russian Government from the Canadian Car and Foundry Company. At the present time the Bridge Company's plant is turning out some 1,200 shells per day, and within a few days this capacity will be increased to 1,800.

**Workshops in War.**—For the purpose of making repairs to auto trucks without unusual delay, such as those used in warfare, for instance, traveling workshops have been built by some English firms, and these have done great service at the front, and many machines have been rescued which otherwise would have been necessarily abandoned. A typical shop of this kind has a three-horse power gasoline engine which drives a dynamo that supplies lights for working at night, and also for a grinder and a portable drill. It also furnishes power for a six-inch lathe that is provided with milling and other attachments, as well as screw cutting. The outfit includes a bench with a vise, an anvil, forge and extensive assort-

## New Incorporations

**Julius Kayser & Co.** has been incorporated at Ottawa, Ont., with a capital of $25,000, to manufacture silk, wool and other textile fabrics of all kinds, at Sherbrooke, Que. Incorporators—J. Kayser, E. S. Bauer, and M. A. Myers, of New York City, N.Y.

**Hydro-Electric Radiation, Ltd.**, has been incorporated at Ottawa, Ont., with a capital of $500,000, to carry on the manufacture of radiators, stoves, and all kinds of heating appliances, at Toronto, Ont. Incorporators—G. E. Harrison, J. Templeton, and H. C. Long, all of Toronto, Ont.

## CLASSIFIED ADVERTISEMENTS

¶ Those who wish to sell or buy a business, obtain competent help, connect with satisfactory positions, or secure aid in starting new enterprises should not fail to use the Want Ad. Page of "CANADIAN MACHINERY."

### FOR SALE

FOR SALE—A HIGH PRESSURE CORLISS engine, in perfect condition; 100 H.P., including water heater and all attachments. Can be seen in working condition at King Building, 122 Wellington West, City.

TAKE NOTICE THAT THE STANYON Metallic Furniture Co., Limited, of the City of Toronto, Canada, duly manufactured the movable grate covered by Canadian Patent No. 101,997, and that the Bennett & Wright Co., Limited, of the same city, duly manufactured the hot water heater covered by Canadian Patent No. 107,120, prior to the period called for by the Patent Act, and on application to the undersigned any further orders for the two above inventions will be filled at a reasonable price. Ridout & Maybee, 59 Yonge St., Toronto, solicitors for Anders B. Reck.

## Foundry and Machine Shop

To locate in the flourishing Town of Hawkesbury, where amongst four fairly large manufactories, in the last three years one firm alone used 400 tons.

WHERE—Abundant electric power is available at reasonable rates ($25 H.P. per annum).

WHERE—Shipping is easy by the G.T.R. and Canadian Northern main line and Ottawa River

WHERE—Much old casting and scrap iron is available.

WHERE—An important famous trade in foundry work could be waked up.

Also good opening for other industries.

For particulars apply to
BRUNO BOUVRETTE,
Secretary,
Hawkesbury Board of Trade.

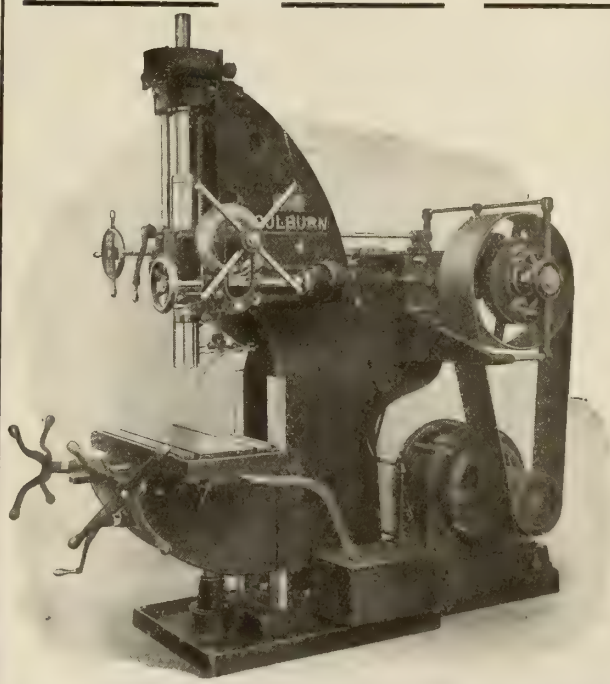
HEAVY DUTY DRILL PRESS



This is a machine that will give the greatest possible production drilling Lyddite Shells. Adapted also to a wide variety of ordinary drilling work.

Stiffness, power and extreme rigidity permits driving drills at highest speed.

Convenience and accessibility enables the operator to handle a Colburn Drill Press with the utmost ease. Built in six sizes.

Write for details.

Colburn Machine Tool Company
FRANKLIN, PA.

## Marine

**Presentation of Flag.**—The Great Lakes Transportation Co., on April 24, was presented with a large Dominion flag by the Town Council of Midland, Ont., for its steamer Glenshee. The presentation was made by Mayor Craig, who expressed, on behalf of the council and citizens generally, their high appreciation of the services rendered the town by the company, and particularly by Mr. Playfair, the president, in having so many boats winter there, providing labor for many citizens, together with the thousands of dollars expended by the company for supplies. Mr. Playfair, in reply, expressed his gratification at the kindly feeling that existed, and said the company hoped to still add to its fleet of steamers, and thereby further the interests of the town as well. Mr. White, a partner of Mr. Playfair, followed. Short speeches were also delivered by other members of the council and W. Finlayson. The Glenshee is the old steamer Hannah, wrecked in the big storm two years ago and purchased by the Great Lakes Transportation Co. She was brought here last fall for repairs, and has given employment to a large staff of men all winter. The company has eight other boats which, with the Hannah, have been painted a battleship grey and re-named, each having the prefix "Glen."

## Catalogues

**Oil Strainers.**—A new bulletin published by the Elliott Co., Pittsburg, Pa., is devoted to a description of their twin oil strainers. Several views are shown of this apparatus with a table of dimensions.

**Tool Steel.**—A bulletin containing sizes and price list of various brands of "Fjab" tool and drill steel may be obtained from the Canadian selling agents, the Canadian Allis-Chalmers, Limited, Toronto, Ontario.

**Gas Furnaces**, made by the Gilbert & Barker Mfg. Co., Springfield, Mass., are dealt with in catalogue "B" recently issued. The various types of furnace for welding, forging, hardening and melting, etc., are illustrated and described, and the principal dimensions are given for each size.

**The Monarch Engineering & Mfg. Co.**, Baltimore, Md., have sent us a series of bulletins describing their heating, melting and galvanzing furnaces, forges, etc. built for all fuels. Full particulars and principal sizes are given for each type of furnace together with illustrations showing clearly the general design.

**Pulley Covering.**—The Gripwell Pulley Covering Co., New York, has issued a folder containing a description of a covering for pulleys designed to prevent slippage of belts and so increase the efficiency of the drive, to the extent it is claimed, of 30 per cent. A description is given of the covering which is composed of specially prepared canvas and cement. The folder is illustrated.

**Reducing Valves** made by the Elliott Co., Pittsburg, Pa., are dealt with in bulletin "L" recently published. The essentials in the design of a reducing valve are discussed in the first place, followed by a complete description of the various types made by the company with special reference to their principal features. Sectional and other views are included of each type accompanied by tables giving the chief dimensions of each size.

**Air Compressors.**—Bulletin No. 1531, a new issue, is devoted to air compressors built by Canadian Allis-Chalmers, Ltd., Toronto. The opening pages deal with the compression of air, generation of heat and its removal, and points to be considered in designing the compressor, more particularly with regard to the cylinders and valves. Following the above is a full description of the air cylinders, valves and other details of the compressor with illustrations of each part, showing exterior and sectional views. The bulletin concludes with a list of questions for use when submitting enquiries. The half tones are excellent and show clearly the principal features embodied in the design of these compressors.

**Boiler Feed and How to Regulate It,** is the title of a new catalogue No 10, being distributed by the Murray Specialty Mfg. Co., Detroit, Mich. The catalogue deals in a general way with the question of boiler feed regulation and also describes the Murray feed water regulator. The installation and operation of the regulator is described at length accompanied by diagrams showing its application. Other apparatus described includes the Murray pump governor, steam trap, blow off valve and safety alarm column. Exterior and sectional views are given of each of the apparatus and the catalogue concludes with a few hints to engineers on boiler operation.

**Grinding Machinery.**—Catalogue No. 101, issued by the Wilmarth & Morman Co., Grand Rapids, Mich., is devoted to a description of various types of drill grinders and other lines of grinding machinery. Special reference is made to the "New Yankee" drill grinders and their essential features are described in detail together with some useful hints

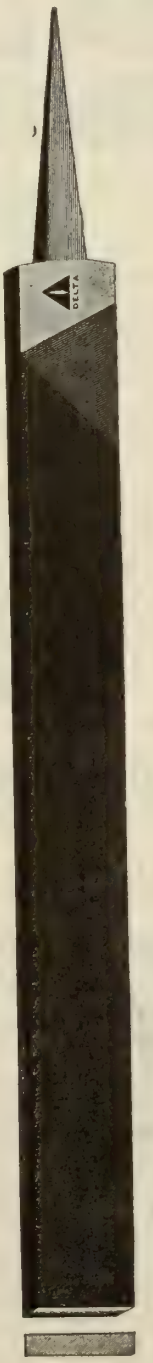
How long do your files cut keenly?



It will be greatly to your interest to keep tab on them — and try a few Deltas and compare the results.

You will find that the

DELTA FILE

has cutting and lasting qualities EXTRAORDINARY, as hundreds of other progressive manufacturers have done.

The reason for the Delta distinctiveness lies in the fact that we are the only file manufacturers that use crucible steel absolutely in files from 3 to 24 inches, and this material is backed by fifty years' experience in cutting and tempering.

There is a shape and size to meet every requirement.

The trade-mark on the tang is a satisfaction or money back guarantee.

BE SURE TO TRY THEM

If your jobber cannot supply you, we will do so, promptly.

HUNTER SAW & MACHINE CO., Pittsburgh, Pa., U.S.A.

in regard to drill grinding. The other types of grinder described cover a variety of work and a specification is given for each. The illustrations which cover each type and numerous attachments are excellent reproductions and give a general idea of the respective designs.

**Coal Drier.**—Bulletin No. 212, issued by the Link Belt Co., Philadelphia, Pa., describes the "Wendell" centrifugal coal drier, which is an automatic machine for drying washed coal for coking purposes. A description is given of the machine and the illustrations show the general construction.

**Pocket Book and Diary.**—The pocket book and diary sent us by Cammell, Laird & Co., Birkenhead, England, is in its every feature, artistic and useful, and just what might be expected of a firm whose reputation for doing all things well in their ordnance, naval and merchant vessel production is world-wide.

**The Peninsular and Oriental Steam Navigation Co.** has issued an exceedingly attractive and useful diary and almanac for 1915. The P. & O., as is well known, has a large fleet of steamers, the names of which are given, with their tonnage. Complete sailing dates for the year for the India and China mail boats are included, together with a lot of useful information for travellers going to the Far East. A number of statistical tables concerning the British Empire form interesting reading, while a series of maps show the trade routes and ports of call for the line. The diary is bound in stout buff-colored linen covers, with pockets for tickets, stamps, etc., all of which are more or less useful to travellers.

**"Engineering Bulletin No. 10."**—The Peterson Power Plant Oil Filter and Accessory Apparatus for Central Oiling Systems, is the title of a 32-page catalogue recently issued by the Richardson-Phenix Co., of Milwaukee, Wis. This catalogue describes the construction and operation of the new Peterson power plant oil filter, and it is stated that filters of this type having a total filtering capacity of over 1,500,000 gallons are now in operation. Curves are reproduced showing the results of some interesting tests made on oil taken from one of these filters and a chapter on the necessity of using filters in connection with steam turbine oiling systems contains much new information. The catalogue contains fifty illustrations showing many important installations of Peterson filters and oiling systems. Copy may be had by addressing the company as above.

**SEND YOUR INVENTION DIRECT TO OTTAWA—**

The Patent business of Canada naturally centers in Ottawa. Here are the records of the Patent Office, and here is its examining corps, before some one of whose members all Applications for Letters Patent must pass for review and criticism. That such application may be facilitated and **much time saved by the employment of competent attorneys on the ground** with ready access to the Patent Office for personal oral discussion of cases with the examiners and prompt filing of amendments and other documents, is obvious. This is admitted by all the large firms located in other cities, practically all of whom are represented in Ottawa, and that **inventors have come to see the great advantage of sending their cases direct to Ottawa,** avoiding the delays and occasional misunderstanding, incident to passing the case, and amendments through two or more Attorneys' offices, is abundantly shown by the large number of applications filed directly through Ottawa Patent Attorneys.

Being located only one door from the Patent Offices, we are in the best position to give you valuable assistance in securing your Canadian Patent. We assure you that in placing your Invention in our hands, it will receive prompt and competent attention. The policy of this firm is to give the best satisfaction possible to our clients.

**WE MAKE A FREE SEARCH OF PATENT OFFICE RECORDS—**

If you have an invention, send us a sketch, photograph or model of it. We will give you a report as to its patentability absolutely free. **We have a number of mechanical engineers and skilled draftsmen who are at the service of our clients to assist them in perfecting their inventions with meritorious ideas, and who require expert advice to produce the invention in practical and commercial form, and the suggestions of our experts are of great aid to our clients.**

**PATENTS FOR SALE** ☛ We invite Manufacturers and Promoters to address our Sales Department regarding the purchase or leasing of a number of meritorious Patents secured by us.

# The Publisher's Page

By B.G.N.

IT is with a feeling akin to satisfaction that we present to our readers this, our second, Shell Number.

¶ Thanks to co-operation on the part of both the military authorities and shell manufacturers, (a co-operation we were denied in developing our first shell number), we have been able to compile an issue which, from an editorial standpoint, is perhaps the most complete and instructive treatise on Shell Manufacturing that has been published. Certainly it deals with Canada's new industry in the most thorough manner.

¶ And in a very short time we have gathered together in our advertising sections a most remarkable group of announcements relating to Shell Manufacturing Machinery, Accessories, and Supplies. This would indicate not only confidence in the buying power of our manufacturers at this time, but confidence as well in the value and high standing of CANADIAN MACHINERY as an advertising medium — a confidence and a faith which has been well placed.

¶ As a source of information on the subject of Shell manufacturing, and as a guide in the purchase of suitable machinery, our Shell Number will be found as valuable as it is complete. We recommend it, therefore, to the careful consideration of not only our Canadian readers, but to manufacturers of war munitions in Great Britain and to our many friends in the United States and other countries.

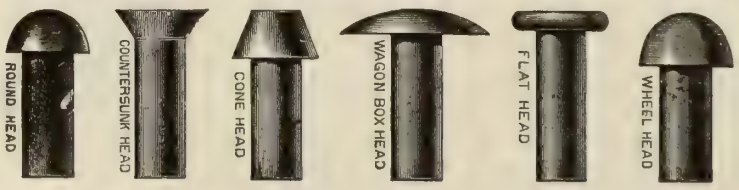
# WOOD SCREW MACHINES

Cable Address:
Cook, Hartford, U.S.A.

**Asa S. Cook Co.**

Hartford, Conn.



**WE MANUFACTURE RIVETS of every description, ½ inch. dia. and smaller.**

**PARMENTER & BULLOCH CO., LTD.**
GANANOQUE, ONT.

# CUT GEARS

*Theoretically Correct*

PROMPT SERVICE

**ROBERT GARDNER & SON**
LIMITED
52 NAZARETH ST., MONTREAL, P. Q.

RAWHIDE OR METAL

## PERFORATED METALS

Write to us regarding your Tool Room partition problems. We can save you space and light.

We make any size perforation in any kind of metal required.

**Canada Wire & Iron Goods Co., Hamilton**

We also manufacture
- Wire Cloth for all purposes
- Concrete Reinforcement
- Molders' Riddles and Bellows
- Metal Clothes Lockers
- Steel Factory Stools
- Window Guards
- Ornamental Wire and Iron Work

## U. S. Electric Drills and Grinders

**Save Time, Labor and Money**

They can be attached to any lamp socket.

For drilling in metal they are superior to any other kind of portable drill. Cost 50% less to run than air drills.

3 SIZES.
3-16 inch, W.G.T., 6 lbs.
¼ inch, W.G.T. 9 lbs.
⅜ inch, W.G.T. 12 lbs.

All motors wound for 110 or 220 volts Direct or alternating current.

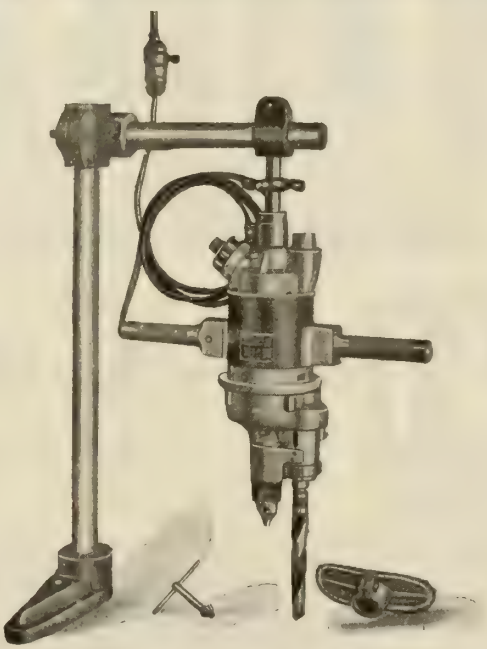
Try a few of our Electric Drills and Grinders and you'll send us an order for more. Our guarantee protects you.

½ inch—2 SPEED.
Speed, 400-750 R.P.M.

For Sale By
**The Canadian Fairbanks-Morse Co., Limited**
Montreal, St. John, N.B., Toronto, Winnipeg, Calgary, Vancouver.

**THE UNITED STATES ELECTRICAL TOOL CO.**
CINCINNATI, OHIO

## Stow Two Speed Two Spindle Drill



The only tool of its kind on the market. Fills a long-felt want. Will cut your cost.

**We sell drills of every size.**

**STOW MFG. CO., Binghamton, N.Y., U.S.A.**
**London, England, Stock: 85 Queen Victoria Street**
Oldest Portable Tool Manufacturers in America.

# Nova Scotia Steel and Coal Company, Ltd.

## BEG TO ANNOUNCE

That their new Steam-hydraulic Forge Shop is now in operation, as also is their recently installed "Harmet" Fluid Compression Plant.

These improvements bring "Scotia's" Equipment abreast of the best foreign forges.

They are accordingly open to supply forgings of all shapes and sizes, made of Best Ordinary or Fluid Compressed Open-hearth Steel, and satisfying the most severe specifications.

# MALLEABLE IRON

Trade Mark

## Castings

***Any Size—From Ounces Up***

Trade Mark

We make all kinds of Malleable Iron Castings, and all of the highest quality.

Our years of experience assure you the best service and castings that are satisfactory in every particular. WRITE us about your requirements.

## International Malleable Iron Co., Ltd., Guelph, Ont.

# Defective Castings Made Perfect

*Make-overs eliminated and many dollars saved*

by the use of

## SHELTON Metallic Filler

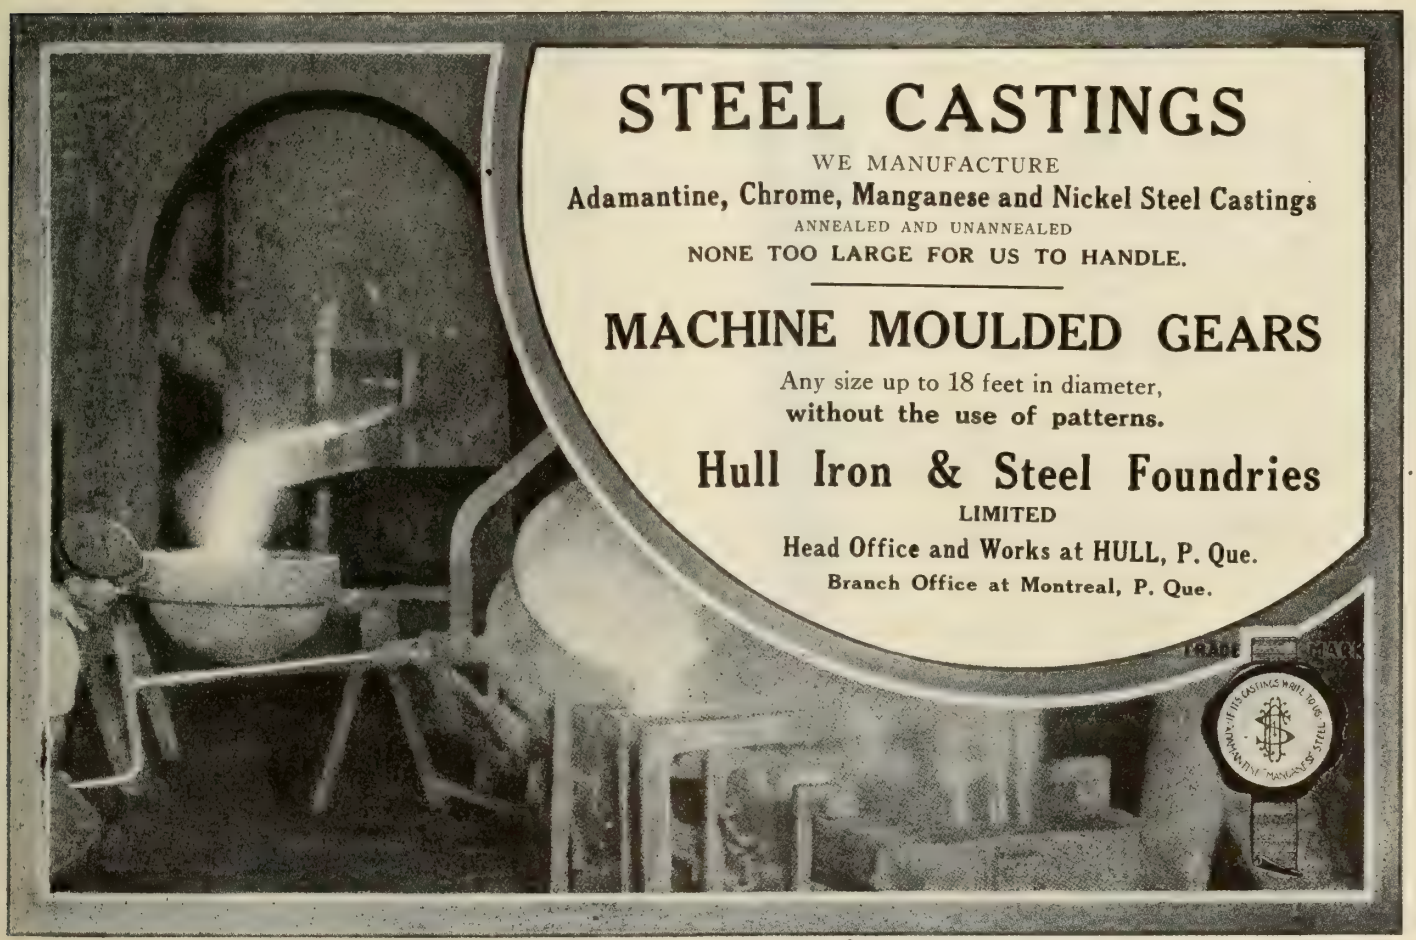
It completely obliterates blow holes, sand holes, etc. It becomes part of the casting itself, is durable, and can never be detected.

**Shelton Metallic Filler** not only prevents costly "make-overs," it enables you to ship every order on time. **No delays, no disappointed customers, no lost business.**

Don't let another casting go to the scrap-heap. Use Shelton Metallic Filler RIGHT NOW. **Its reliability has been proved by many years' successful service in America's leading manufacturing plants.**

Dictate your request for further particulars.

**Shelton Metallic Filler Co.**
**DERBY, CONN.**



## STEEL CASTINGS

WE MANUFACTURE

**Adamantine, Chrome, Manganese and Nickel Steel Castings**

ANNEALED AND UNANNEALED

NONE TOO LARGE FOR US TO HANDLE.

## MACHINE MOULDED GEARS

Any size up to 18 feet in diameter,
**without the use of patterns.**

## Hull Iron & Steel Foundries

LIMITED

**Head Office and Works at HULL, P. Que.**

**Branch Office at Montreal, P. Que.**

## The Wilt Twist Drill Co. of Canada, Limited

1. Has more money invested in drill making equipment than any other company in Canada.

2. Carries the largest stock of drills in Canada, and

3. Makes drills of as high quality as are made anywhere in the world.

**Ask your jobber for them or write us.**

# CONCERNING HOLES

INCREASED production of rough and finished holes can only be obtained with drills and reamers that are made of ***better*** steel, which has been scientifically hardened and tempered.

Fewer grindings, due to these facts, mean time saved and a lengthened life for the tool.

Users of Cleveland Drills and Reamers tell us that our tools excel in these respects.

# NEWTON
## COLD SAWS ON SHRAPNEL STOCK

No. 1—Newton cold saw in operation in the plant of the Goldie & McCulloch Co., Ltd., Galt, Ont. This company uses four Newton Saws.

No. 2—Newton Cold Saw cutting off *four pieces at once* in the plant of a well-known Montreal engineering shop.

No. 3—Fuller view of Newton Cold Saw in the plant of Goldie & McCulloch Co.

**Single Bars cut in 1½ minutes. Four Bars cut at once in 3 minutes.**

Shrapnel stock is 46 point carbon, 60 to 70 point manganese, 3½" diameter. Ask your neighbor about it.

It takes *strength and power* to drive saws at these rates in work of such tough character; but these are features you'll find in every Newton Saw. With Newton Saws cutting rates are limited only by the strength of the saw teeth; whether it is our smallest machine or one of the "big fellows" which is used.

YOU'LL FIND NEWTON MACHINES WITHOUT SUPERIOR ON HARD, STEADY WORK—JUST THE TOOLS TO SHOW TO BEST ADVANTAGE ON SHRAPNEL, SHELLS, GUN PARTS, ETC.

*Write for complete catalog of Newton Machines—Cold Saws, Milling and Boring Machines, Rotary Planing Machines, etc.*

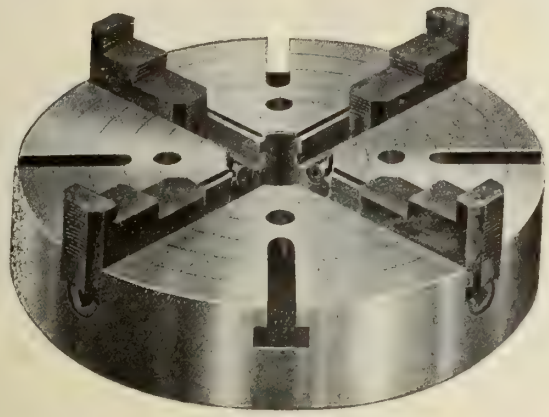
## Chuck Service—Extraordinary



# THE IMPERIAL Improved Independent 4 Jaw Lathe Chuck

Jaws ground true on face after chuck is assembled.

Hardened Steel Bearings and Screws that extend to outside of body.

BY BUYING THE IMPERIAL CHUCK YOU WILL GET AS GOOD A CHUCK AS IS PROCURABLE, SAVE DUTY, AND KEEP MONEY IN CANADA.

**KER & GOODWIN, Brantford, Ont.**

## For Rapid Production and Accurate Work

USE THE

# "BRIGGS"

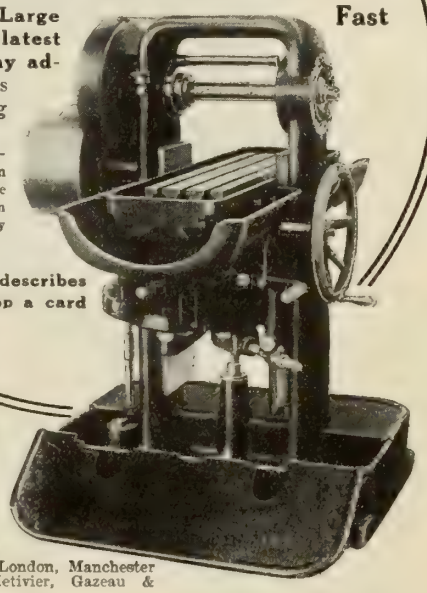
**The Briggs Miller handles work no other machine of its size can touch.** It is a manufacturing machine. On account of its rigid construction it will produce accurate work when running at a high rate of speed and feed.

**The Base Tank and Large Gear Pump is the latest addition to its many advantages.** Tank holds 20 gallons of cutting lubricant.

Pump never requires priming and will deliver ten gallons per minute to the cutters, keeping them cool when run at very high speed.

**Our booklet describes fully. Drop a card for it.**

Fast



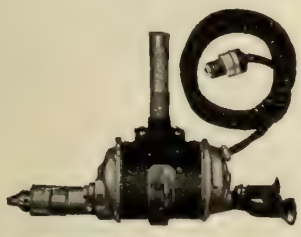
**Gooley & Edlund Inc.**
**Cortland, U.S.A.**

FOREIGN AGENTS: Allied Machinery Company of America, France, Belgium, Italy, Switzerland, Russia, Scandinavia. C. W. Burton, Griffiths & Co., London, Manchester and Glasgow. Barandiaran, Metivier, Gazeau & Cia, San Sebastian, Spain.

# "Cincinnati" Electrics

**Are Sent on Trial**

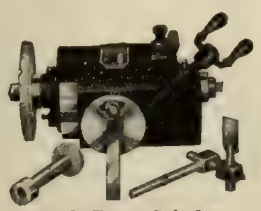
**Return if not Satisfactory**



Hand or Breast Drill

Made in 12 sizes, ¼ to 2½" capacity. Weight from 7 pounds up. Ball and Thrust Bearings throughout. All gears and working parts hardened.

**SCREW FEED DRILLS**
**SCOTCH RADIAL DRILLS**



Tool Post Grinder

All sizes and types, ¼ to 3 H. P. Weights from 16 pounds up. For grinding centers, dies, rolls, internal or surface grinding of all kinds. Motor fully enclosed. Dust and dirt proof. Bronze bearings adjustable to wear.

**BENCH AND FLOOR GRINDERS.**

**HAND AND AERIAL GRINDERS.**

**New Catalog No. 6 ?**

**For Sale by Mussens Limited, Montreal and Branches. H. W. Petrie, Limited, Toronto.**

## Cincinnati Electrical Tool Co.
**Cincinnati, Ohio**

# ON LYDDITE SHELLS USE McKENNA HIGH SPEED DRILLS

*They're Tempered Right*

*And Milled In the Web*

Made from highest grade Vanadium, Tungsten Cobalt Tool Steel of exceptional cutting and long wearing qualities.

The milled web and thin center makes these drills absolutely true at all points.

**Most called for sizes IN STOCK FOR IMMEDIATE DELIVERY**

**Order to-day**

# ELECTRIC STEEL CASTINGS

E S & M

BRAND

**Stands for Quality.**

High-Grade Steel Castings of every description.
Clean, Sound, and true to pattern.
From 1 lb. and upwards.

Manganese and all Alloy Steel Castings, Mining Bar and Rock Drill Steel, Forging Ingots.

**WRITE FOR PRICES AND PARTICULARS.**

**THE ELECTRIC STEEL & METALS COMPANY, LTD.**

**Welland - Ontario**

# No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.

Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.

*How to use Stevens' Stopper, or Circle Cement:*

Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.

Another thing—I do not ask a fancy price for it.

A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

"KEYSTONE"

**Forged Steel "WESTCOTT" Wrench**

All parts are made from steel forgings.
No. 1. Polished all over.
No. 2. Polished Head--Enamelled Handle.
Look for the trade-mark "Westcott" on the handle.

**The Original "WESTCOTT" Adjustable "S" Wrench**

HANDLE MALLEABLE IRON, JAW FORGED STEEL.
The "Westcott" Wrench is acknowledged to be the most convenient and useful wrench for general use, and can be used in many places inaccessible to the Monkey Wrench. These wrenches are made of first-class material, are strong and durable.

The genuine "Westcott" Wrenches have the trade-mark "Westcott" on the handle.

**"KEYSTONE" Weston Ratchet**

For Square Shank Drills Only.
STRONGEST RATCHET MADE.
Fully guaranteed.

# "Keystone Quality"

Is the kind that "Mechanics Who Know" are "Strong After" because of its far-reaching service and reliability.

Why not add these Quality Tools to Your Kit Now? They are a Wonderfully Good Investment.

**Fully guaranteed. Drop postal for catalog.**

Every reliable wholesale supply or jobber carries "Keystone" products.

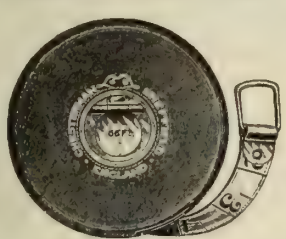
Let us refer you to your nearest dealer.

## THE KEYSTONE MFG. CO.

**BUFFALO, N. Y.**

**KEYSTONE "Model K" Wrench**

All drop-forged steel.
No. 1—Polished all over.
No. 2—Polished Head—Enamelled Handle.
Look for the trade-mark "Keystone" on the handle.



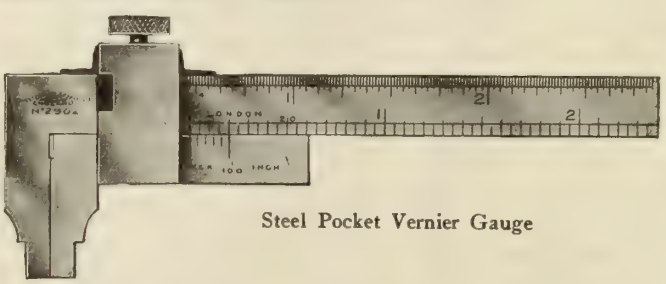
Wind-up Measures, Steel, Linen and Metallic. With Improved Patent Flush Handle.

# JAMES CHESTERMAN & CO., Limited

**SHEFFIELD, - ENGLAND**

**Manufacturers of Measuring Tapes, Steel Rules, Straight Edges, Surveyors' Band Chains, Engineers' Tools.**

Steel Depth Gauge



Steel Pocket Vernier Gauge

If your dealer cannot supply you, write for catalogues, prices, etc., direct to

**F. H. SCOTT, 404 Coristine Building, MONTREAL**

# DON'T BE A PASSIVE RESISTER

in refusing to advertise merely because you **think** you can't get results. Face the facts and ask yourself if an announcement going to thousands of Engineers, Consulting, Operating and Superintending, all of whom are interested in your goods, is not going to have a selling advantage over and far greater than if your name was never seen.

**RATE CARD AND FULL INFORMATION ON REQUEST.**

*If what you want is not advertised in this issue consult the Buyers' Directory at the back.*

# The New—The Better
## Trucking System

One man with one Barrett Multi-Truck will do more and better work than five or six men operating ordinary trucks.

One Barrett Multi-Truck operated by one man can do the work of twenty ordinary trucks.

# The Barrett Multi-Truck

**The ideal truck for handling SHRAPNEL SHELLS.**

To move material, the Barrett Multi-Truck is simply backed under a specially designed platform, the handle of the truck is pushed down. This raises the truck bed and with it the loaded platform. The truck bed is automatically locked in this raised position, and the loaded platform is then hauled where desired.

Platforms may be built up any desired height, so that workmen can receive their material on machine-high platforms, and as they complete their work, pile the finished parts on another machine-high platform which is then hauled away to the next workman.

The Multi-Truck does away with incessant loading and unloading of trucks—all unproductive effort,—you handle your material only once. And think of the convenience—one Barrett truck, one hundred platforms.

The Barrett Multi-Truck is strongly made, and there is practically no wear-out to it. The frame and axles are made of steel; Hyatt Roller Bearings in all four wheels. A pull of fifty pounds will start a 4000 lb. load on a level floor. In short, we offer you a substantially built roller bearing truck at a moderate price. It will last a lifetime.

VERY EASY TO OPERATE.

Four wheels. Hyatt Roller Bearings.

WRITE FOR FULL PARTICULARS.

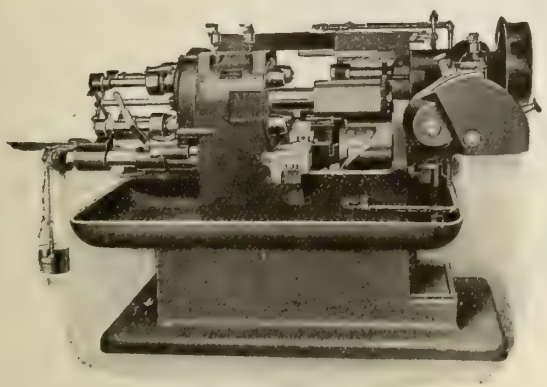
# Gridley Automatics

## SINGLE AND MULTIPLE SPINDLE

Gridley Automatics **GUARANTEE ACCURACY** because the stiffest and most effective type of cutting tool can be rigidly held close to the work without overhang.

"GRIDLEY" Multiple Spindle Automatic



Each tool is supported close to its cutting point, which completely obviates the spring and consequent inaccuracy which cannot be overcome when a necessarily long tool is held by its shank, as is the case with all other automatic turret lathes.

GRIDLEY AUTOMATICS **GUARANTEE A LARGE OUTPUT** because the rigidity of the tool permits heavier cuts and coarser feeds, and its form insures the highest efficiency, while the arrangement upon the tool slide allows for the use of tools tandem, and thereby doubles or trebles the work of a single operation.

**Our catalog,** CONTAINING OTHER DISTINCTIVE GRIDLEY FEATURES, **is ready for mailing. Be sure to ask for a copy.**

# LINCOLN

Type

## Milling Machine

No. 8

The "Lincoln" Miller of to-day marks a great advance in the development of this type of miller, having raised it out of the limited field in which it was used and adapted it to the **economical production of work which would otherwise call for the purchase of costly machinery.**

Both head and tail blocks are giblocked to bed with alignment of spindle corrected from this position with table by proof bar. Feed mechanism for table is entirely on the outside, which does away with the necessity of large-cored holes in bed through which to make feed connections, thus materially weakening the casting and reducing its ability to support table under heavy cuts.

Write for "Lincoln" Miller Catalog. It contains many interesting illustrations.

# OUR ELEVATING TRUCK

*is indispensable in the handling of*

# Shrapnel Shells

*or any factory product where numerous operations are required*

Patented in Canada
Patents Pending in Foreign Countries

## OPERATION:

All material is stacked on platforms. To move material the truck is backed under the platform; the handle of the truck is then pushed down, keeping the button depressed, which raises the truck bed, and with it the loaded platform, at the same time automatically locking it in its raised position. When hauled to the desired position the button is pressed and the handle raised, lowering the platform to the floor. The truck is then drawn from underneath and is ready to move another platform.

## SIMPLICITY IN MECHANISM

Raising and lowering of the truck can be operated with one hand only—can be raised or lowered at any angle. Specially designed ball-bearings throughout.

**ANY MATERIAL THAT CAN BE STORED ON PLATFORMS OR IN BOXES CAN BE MORE ECONOMICALLY MOVED WITH THIS TRUCK THAN BY ANY OTHER MEANS.**

## SIGNS OF THE TIMES

¶ Even the worst calamity howler in the country doesn't need a telescope now in order to get a glimpse of the silver lining of the cloud that has been drifting over us for the last nine months.

¶ With the coming of spring a noticeable change has taken place, and all the signs are hopeful. There are many indications that business is gradually returning to normal, and we look for a steady improvement.

¶ "Banks' Position Very Exceptional," says the Financial Post—"Savings Deposits much higher than heretofore," "Business outlook more cheerful—Crop reports continue to be excellent."

**HELP WANTED**

¶ The once familiar sign—"Help Wanted" is again coming into more general use, and we know of no more encouraging sign of the times than this. A Toronto daily paper, noted as a "want ad" medium, reports a heavy increase in advertisements classified as "Help Wanted."

¶ With the gradual return to normal, and very likely unexampled prosperity, there will be a proportionate increase in the purchasing power of Canadian industries. This should suggest prompt action in influencing that particular share of business which, under proper conditions, should belong to **YOU**.

¶ The wise farmer sows his seed in the spring time, and takes his chances on the harvest. Don't wait until you see the other fellows reaping their harvest before you start **your** campaign of seeding and cultivating. You can't hustle around, sow your seed, and force a crop in a few weeks. It just can't be done.

¶ A half-page well planted now will yield greater returns than a full page hurriedly sown when the harvest should be ripe.

¶ Why not take advantage of the signs of the times, and commence a steady campaign in CANADIAN MACHINERY at once? You will find our readers in a receptive mood and ready to consider your message.

*Rate cards and full information will be sent on application.*

# Efficiency

Manufacturers do not hesitate to discard expensive machinery when the time and labor wasted on such old equipment more than offsets the cost of new machines.

Every file should be considered as a machine. At a certain point in its life on any work it becomes so worn that its efficiency is impaired. It is slow—dull—inaccurate. The extra time it wastes in performing its work would more than pay the cost of several new files.

In the interest of efficiency and economy, it should be replaced with a new file—just as old machines are replaced with new equipment.

This "discard" point in any file varies with the skill of the worker and the character of the work. It is very late in the

## "Famous Five"

KEARNEY & FOOT
GREAT WESTERN
AMERICAN
ARCADE
GLOBE

*(Made in Canada)*

because they are designed for a long period of maximum service.

They are made by the world's greatest file producers—with an output of 60,000,000 per year. They are manufactured on machines designed to make a tooth that will remove stock rapidly. They benefit by all the skill, experience and knowledge gained in our 50 years' experience. Every step in their manufacture—from steel to finished file—is controlled by us.

Before any of the "Famous Five" leave our works, they must pass tests far more strenuous than any practical work they ever meet.

YOU, too, can cut down your filing cost by using the "Famous Five"—and replacing them promptly when they have lost their efficiency.

# Shrapnel Shell Manufacture

## Shell Department of a Structural and Bridge Works

Staff Article

*A plant devoted to fabricating and erecting structural steel is not such as we would expect to make a tremendously successful showing on the production of machine tool work requiring adherence to imposed comparatively close limits. That we have a structural steel plant equal to the latter task will be quite apparent from a study of the accompanying article.*

CONCURRENTLY with the growing demand, all manner of iron and steel working industries have effected alterations in their machine shops, whereby shrapnel shells can be rapidly and economically manufactured in quantity as desired. The fact that many plants have been busily engaged in such work has been more or less generally known; at the same time, little information as to the equipment layout and the machining and other processes have been available. Shops engaged in the production of shells are, generally speaking, operating very efficiently, and much ingenuity and resourcefulness has been displayed by those responsible for their administration and organization.

Particularly do these remarks apply to the shell department of the plant here described and illustrated, because there is a vast gulf between the work of fabricating and assembling bridge girders, columns, beams, etc., and the delicate operations required in the machining of shrapnel shells.

### General.

The equipment has practically all been purchased for this particular work of machining shrapnel shells, and by referring to the general layout plan the operation routine can be traced. The blanks are not forged in this plant, but are obtained from outside sources. A large number of the operations are performed on flat turret lathes, and these are equipped so as to secure that the particular objectives be accomplished in three series of operations. The finishing operations are performed either by grinding or finish turning on engine lathes. The turning of the copper bands and the finishing of the brass sockets are simple lathe operations, and are accomplished on lathes of various types and makes, which have been available on short notice.

Perhaps the easiest way to appreciate the completeness of this particular installation is to follow a shell throughout its course from the forging to the finished product.

### Cutting-off and Rough-facing.

The first operations are cutting-off the open ends and rough-facing the blank ends of the shell. These operations are accomplished on machines that were formerly Hall, Brantford, thread-cutters, and have been refitted to do this work. The shell is slid on to a universal chuck and pushed in, until a stop is reached, which stop enters the hollow centre of the shell and comes in contact with the inside bottom of it. The cutting-off operation is accomplished by two tools working towards the centre. Both tools

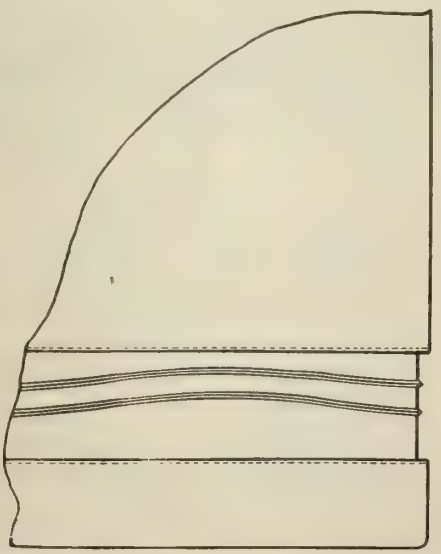

FIG. 1. PART DEVELOPMENT OF SHELL SHOWING WAVED RIBS (THREE WAVES).

are power-driven from the same feed screw, which has a right and left-hand thread on either end, and is connected by a worm and worm gear to a shaft which is belt-driven from an extension of the cone pulley shaft. In this operation, a cutting lubricant of soda water is used. About thirty shells are machined without regrinding the tools. Two machines are fitted up for the cutting-off of the blank ends of the shell.

The next operation of roughly cutting off the open ends to length is also being done on three adapted Hall machines which operate somewhat similarly to the others, but have a slightly different tooling arrangement. The cut is, of course, not so deep as in the case of the blank end and can therefore be accomplished much more quickly.

In the regular machine shop of the plant, a number of standard lathes have been fitted up to do the above work, and universal chucks are generally utilized with a stop of some simple construction. Parting tools are fed in by the cross-feed of the machines. A 48-in. Bullard boring mill is used for facing the blank ends, a circular jig being bolted to the table of the machine, and 24 shells being handled at one time. A tool in each of the two toolholders is used, and the average rate of machining is about 50 shells per hour.

The best runs on the two operations are as follows:—Cutting-off the back end, 240 shells in 11½ hours; Cutting-off of the open end, 535 shells in 11½ hours, each operation being accomplished by one man on one machine.

### First Setting on Flat Turrets.

After the cutting-off operation, the shell goes to one of the many Jones & Lamson and Pratt & Whitney flat turret lathes, to be put through the first series of operations. There are four distinct operations in the first series, as shown in Fig. 13. In the first operation, the shell is slid on to the centering chuck shown in Fig. 17, and up against the stop as shown in Fig. 13. This centering chuck was designed by the engineer in

charge of the department. The body of the shell is rough-turned up to about 2 inches of the open end, and a second tool turns the shell to finished diameter for the same distance. The blank end of the shell is next re-faced and the recess formed, after which the corner of the shell is rounded.

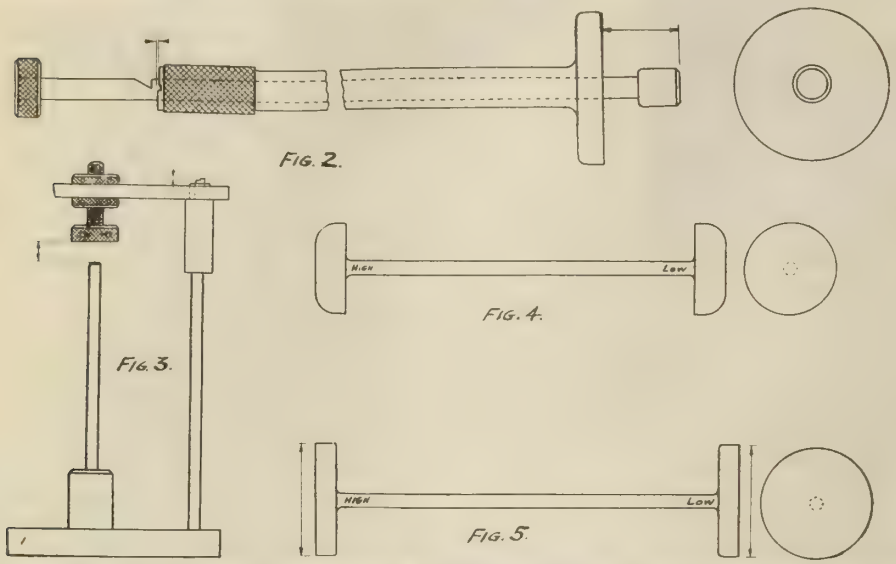

FIG. 2. FIG. 3. FIG. 4. FIG. 5.

FIGS. 2 TO 5. GAUGING APPARATUS EMPLOYED IN THE MACHINING PROCESSES.

As will be seen in Fig. 1, there are wave lines in the bottom of the recess groove, sufficient material is therefore left in the bottom of the recess for these lines to be later formed. The recess, however, is made full depth at the extreme outside edges. The next operation is the under-cutting of the edges of the recess. This under-cutting is made so that when the copper band is pressed into the groove it will fill up the under-cuts and be securely held in place. For a similar reason, the wave lines are turned in the bottom of the groove. The general form of these wave lines, which are formed in the next operation, can be seen from Fig. 1. On the face of the chuck a carefully designed triple wave cam has been placed, Fig. 13. By referring to Fig. 18, the tool can be seen, and it will be noted that this tool is guided by the form of the wave cam. Thus, what promised to be a difficult piece of work—has turned out to be extremely simple. This completes the first series of operations on the flat turrets. The production per hour of one machine is about seven shells, and the best run on one machine has been 110 shells in 10½ hours.

### Second Setting on Flat Turrets.

In this setting, the shell is reversed in the chuck and placed against a stop as shown in Fig. 14. The principal operation is that of boring in this second setting. There are four independent boring tools placed on the turret, and Fig. 14 also shows the ingenious method of holding these boring tools rigidly in position. A solid bar extends right across the turret and is supported by the two holders. The other two boring bars are mortised into the solid bar. This gives excellent support.

When the shell is chucked, the nose end is rough-turned and the end re-faced. The next operation is to rough-bore the powder pocket. The disc seat is then rough-bored, both afterwards being finish-bored. Stops on the machine indicate to the operator when the depth of bore is accomplished. The tool does not bore its way into the whole depth of the shell, the forgings being so made that there is only a small amount of metal to be removed at the shell bottom.

The shell is now removed and the operator blows out all the chips and any cutting lubricant that remains, by means of a jet of compressed air. A gauge shown in Fig. 4 is then inserted to see if the powder pocket is between the limits allowed, and this formed gauge has a small and large end, each of which represents the corresponding limits to which the shell may be bored. The disc seat is similarly treated with the gauge shown in Fig. 5, which was made for this special purpose. The depth of the bore between the disc seat and the bottom of the powder pocket is tested with the tool shown in Fig. 2. The thickness of the bottom of the shell is also tested, and this tool is shown in Fig. 3. For this operation, 16 flat turret lathes are employed, and the production per hour of one machine is fourteen shells. One man has machined 140 shells in 10½ hours on one machine.

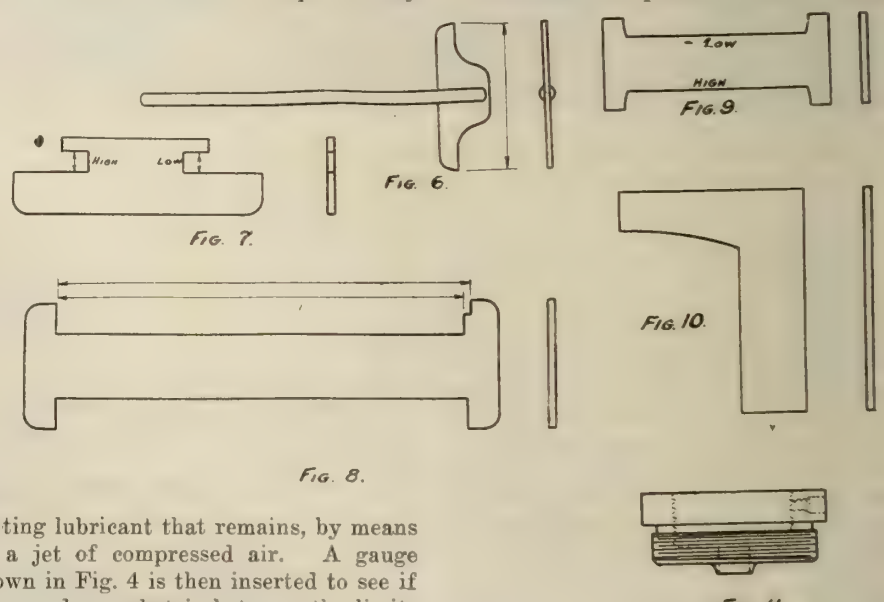

FIG. 6. FIG. 7. FIG. 8. FIG. 9. FIG. 10. FIG. 11

FIGS. 6 TO 11. GAUGES EMPLOYED IN THE MACHINING PROCESSES.

### Heat Treatment and Swedging.

After these operations, the shells are taken to the heat treating department, where they are first placed in a gas furnace. There are four gas furnaces and all were constructed in the plant. The shells are heated to a temperature of 1460° F. and are cooled in tanks of whale oil or Houghton Soluble Oil. There are two tanks and these are placed in containing vessels of water. Connected to the oil tanks are a series of coils placed in the containing vessels. Oil is circulated through the coils and is thus cooled by the water, the circulation being maintained by two centrifugal pumps, each tank having its individual circulating pump. One pump is belt-connected to a 3-h.p., d.c., Can. Gen. Electric Co. motor, and the other is direct-connected to a 2-h.p., d.c., Can. Gen. Electric Co. motor. To facilitate the cooling of the oil, it has been found necessary to agitate it by jets of compressed air, this being supplied from the high pressure lines of the company. A high pressure blower, belt-connected to an 8-h.p., d.c., Crocker-Wheeler electric motor supplies air for the gas furnaces.

The shells are placed in the oil tanks in a box-like galvanized iron retainer, in which a large number of holes have been punched. Over each of the two oil tanks

(11) Bullard boring mill facing base of shells.

a 2-ton hoist is placed. These hoists are used to raise a batch of shells in their retainer out of the oil, which drains off through the already-mentioned holes. The shells are next placed in boxes of sawdust, to absorb all surplus oil adhering to them, and after being tumbled around by hand in the sawdust, two spots on opposite sides are cleaned up with a buffing wheel, on which the test for shell hardness is made by means of a Shore scleroscope. The degree of hardness is marked on each shell and they are placed in shelves according to same. This department is able to handle about ninety-six shells per hour.

The shells next go to the annealing furnaces, of which there are two. These furnaces were also made in the works. The length of time spent in the annealing furnaces and the temperature at which the furnaces are kept, are points determined by the degree of hardness of the shells. An experienced operator is in charge of this department and excellent results are being attained.

The noses of the shells are next heated to about 1,400 degrees F. in a lead pot, and the proper depth of immersion in the lead is obtained by simply slipping the shells over pipes which extend out of the molten lead the proper distance. The lead pots and oil furnace for melting the lead are also products of the works. The fuel used is ordinary crude oil mixed with a jet of compressed air. A little charcoal is placed on the surface of the lead to prevent excessive radiation of heat and oxidation of the metal. It has also been found, with the surface of the lead covered with charcoal and charcoal ash, that the lead does not adhere to the steel.

As soon as the nose of the shell has been heated to the correct temperature, it is bottled in, or swedged. The swedge used was originally a 50-ton Murphy toggle riveter, and is operated by compressed air. A second machine, which was originally a Bertram punch, has been fitted up for the same purpose. Both sizes of shells, namely, the 15 and 18-pounders, can be swedged in either or both machines by simply changing the tools. The toggle riveter is operated by compressed air, while the punch is belt-connected to a 5-h.p., d.c., Can. Gen. Electric Co. motor. In the case of the 18-pounder shell, it is necessary to drop in the steel disc before swedging.

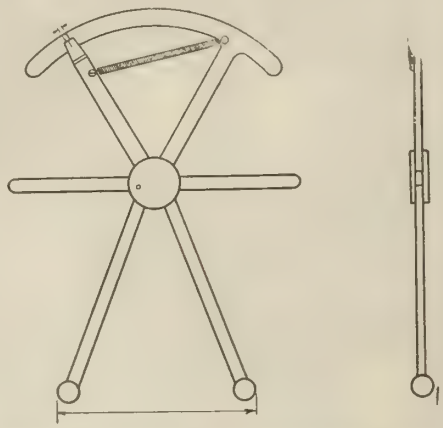

FIG. 12. GAUGING APPARATUS EMPLOYED IN THE MACHINING PROCESSES.

Immediately after swedging, the shell is placed in the lead pot again to be reheated. This second heating is accomplished with the shell immersed in the lead somewhat further than in the case of first heating. As soon as the shell becomes a dull red, it is lifted out by tongs and placed nose downward in a box of powdered mica which allows it to cool slowly, and, at the same time, be out of contact with the air. This process of annealing, as it were, is done to overcome the effects of the chill caused during swedging. It is found that the nose is left sufficiently soft by this process to allow of the finish machining operation to be accomplished without undue difficulty. About 100 shells per hour can be swedged with this equipment.

**Third Setting on Flat Turrets.**

The shell now passes to the third series of operations on the turret lathes. It is chucked with the nose end outward in this operation, as in the second series of operations. A stop in the spindle ensures the shells always being in identically the same place in the machine. The first operation is to bore the inside of the nose and face the end. The outside of the nose is also rough-turned and formed. The forming is accomplished by means of a modification of the tapering arrangement for the flat turret, using one edge of a piece of hardened steel for a template. The tool carriage is kept closely in contact with the forming edge of the template by means of a stiff spring. By a similar operation, the inside of the nose is bored to the profile of a second template. This forming of the inside extends only for a short distance inside the nose of the shell.

After these operations are accomplished, the turret is swung around and the straight bore of the nose is reamed. Another swing of the turret and the end of the nose is tapped. A collapsible tap is used, and the tool is quickly withdrawn when it has accomplished its work. The shell is then inspected by employees of the works, using the tools illustrated in Figs. 6, 7, 8, 9, 10, 11 and 12. The tooling of a turret lathe for this operation is shown in Fig. 19.

After the shell passes this inspection, it goes to the finish grinders, or the finish turn operation. About 14 shells per hour can be machined on a turret lathe equipped with tools for the third operation, although recently one man machined 151 shells in 9½ hours.

Face Back End and Rough Turn Recess Round Corner.

FIG. 13. FIRST SERIES OF TURRET LATHE OPERATIONS.

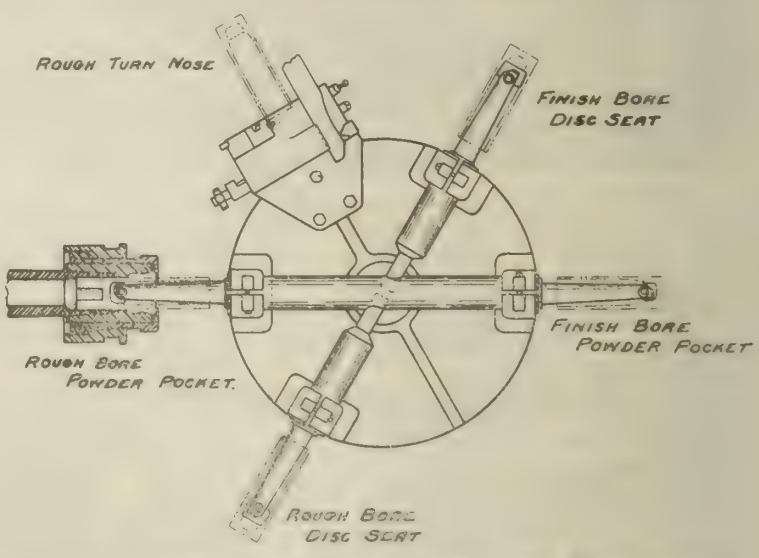

FIG. 14. SECOND SERIES OF TURRET LATHE OPERATIONS

### Grinding Operation.

Before being ground, the shell has to be provided with one centre to be held in the grinding machine. Tools shown in Fig. 15 are placed on the small ends of the shell. These tools each contain little hardened steel centres and are screwed into the small or open end of

FIG. 15. SHELL GRINDING CENTER.

the shell. The shell is clamped in a hinged cylindrical vise while this operation is performed.

In the grinder, the large or back end of the shell is clamped in a 6-inch Skinner scroll chuck, which is fastened to the spindle. These chucks have three jaws. The inserted plug centre is supported by the tailstock spindle. The machines used are four Landis plain grinders: two 10 in. x 24 in., a 10 in. x 36 in., and a 10 in. x 52 inch. The wheels used are of 2-inch face and are traversed the whole length of the shell, from the nose to the recess. The noses of the shells

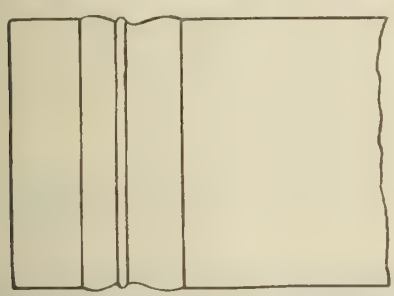

FIG. 16. SHOWING COPPER BAND AFTER TURNING.

are not ground, but are turned. It has been found that it taxes the capacity of these four grinders to keep pace with the production of the other departments. For this reason, the grinding of the nose had to be abandoned, although the operation was being carried on most successfully. The wheels are dressed frequently to assure the finished shell being accurately ground. Limit gauges are provided each operator, and he calipers his work in the machine. The limits allowed on the outside diameter vary by ten one-thousandths of an inch.

### Finish Turning Noses on Engine Lathes.

There are eight lathes of various makes equipped for finish-turning the nose of the shells. The operation is practically simple, except for the fact that the cross-feed has been disconnected. The adjustment of the tool is made by the compound rest. The toolholder is pressed closely against a profile steel template by means of weights suspended in the air, and, as the carriage moves along the bed of the machine, a hardened steel point guides it, as shown in the diagram, Fig. 20. The template is formed of hardened steel and is the exact shape of the profile of the shell. The apron of the carriage is connected to the feed screw as usual.

The annealing process, after swedging, leaves the shells in excellent condition for turning, and it is found that they can be easily turned at the rate of from 40-50 feet per minute with a moderate feed. One operator can finish about 12 shells per hour with a lathe equipped as indicated above. One man, however, has finished 151 shells in 9½ hours.

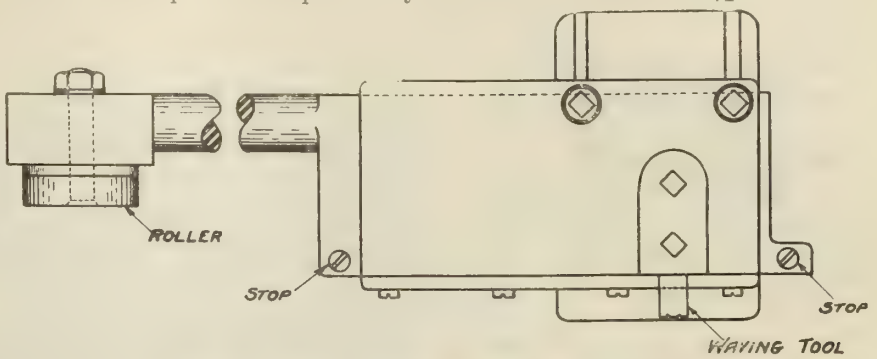

FIG. 18. WAVE FORMING TOOL AND HOLDER.

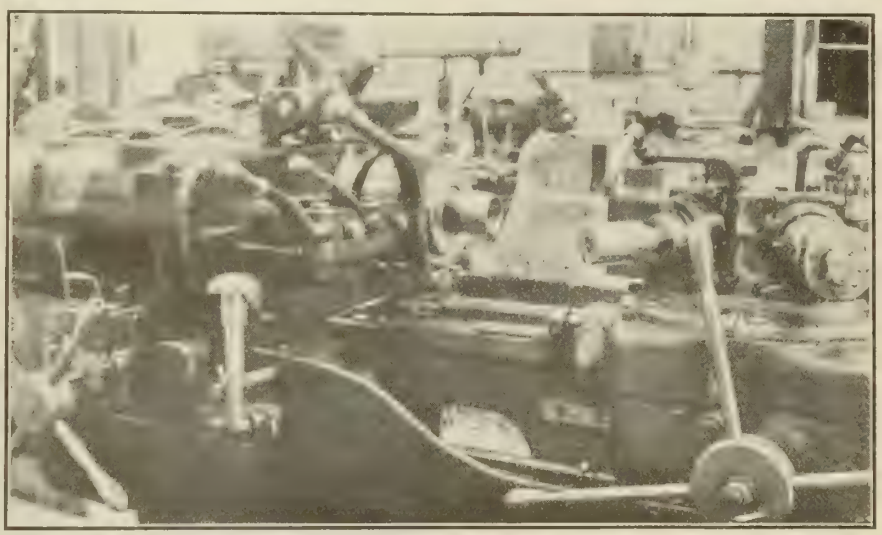

JONES & LAMSON FLAT TURRET TOOLED UP FOR THIRD SERIES OF OPERATIONS.

### Sand Blast and Minor Operations.

After being finish ground and turned, the shells proceed to the sand blast room where the recess containing the wave lines, and also the blank ends are cleaned up, being usually in a blackened condition, resulting from the heat treatment. Next the shells are brought out and washed in a solution of hot soda water. Then three nicks with a cold chisel are made in the waves. These nicks are to give additional resistance to the bands turning after they are once pressed into the grooves and also release the air that would otherwise be trapped between the wave lines.

From the sand blast room, the shells go to a corps of Dominion Government

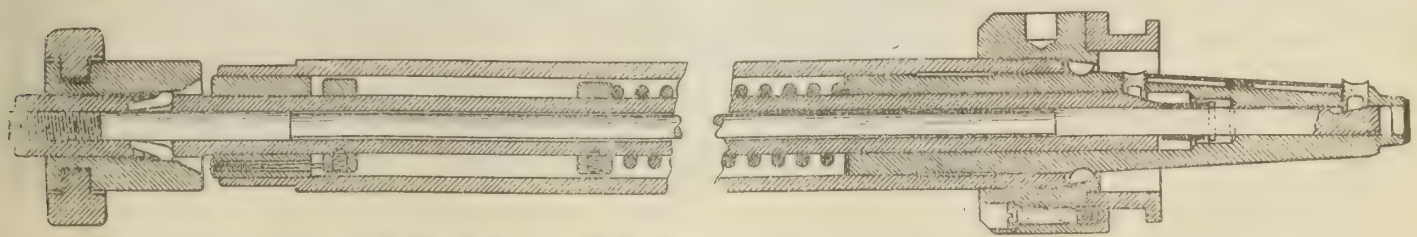

FIG. 17. SECTIONAL VIEW OF EXPANDING CHUCK SHOWING DETAIL.

Inspectors for a first inspection. After coming from the inspector, the shells are marked in a Dwight slate marking machine and the copper bands slipped on loosely and pressed home by two machines especially constructed for this purpose by Lymburner, Ltd., Montreal. As there are two sizes of shells made in the plant, there are two presses, one for each size of shell.

Next, the copper rings are turned to a shape or profile somewhat similar to that indicated in Fig. 16. Fig. 21 is a representation of the tool by which the profile is tested. To turn the bands, the shell is fitted with a plug in the open end similar to that used in the grinding operations. The back end is gripped in a three-jaw Skinner chuck. One man has been able to turn 240 copper bands in 11½ hours.

### Assembling.

The shell now goes to the assembling tables. First the tin powder cup is placed in the powder pocket and the disc placed on top of the cup. Next, the brass tube for the powder is screwed into the steel disc, then a little funnel is placed over the open end of the shell. This has a central guide collar which fits over the end of the brass tube and holds it exactly in the centre. The bullets are now put in the funnel, and the exact number is automatically measured out each time by a very ingenious little apparatus. The approximate number in each shell is 375, and it has been found that there are about 41 to the pound, each bullet being in the neighborhood of ½ in. in diameter.

The shell is placed on an air agitator to settle the bullets into place, and molten resin at from 3750 to 4000 F. is poured into the casing. The shell is immediately thereafter placed on a delicate balance and one or two pieces of small shot added until the exact weight is obtained. While the resin is still soft, the brass socket is started in by hand and screwed down a few turns, the brass thread being coated with red lead before being started in the shell.

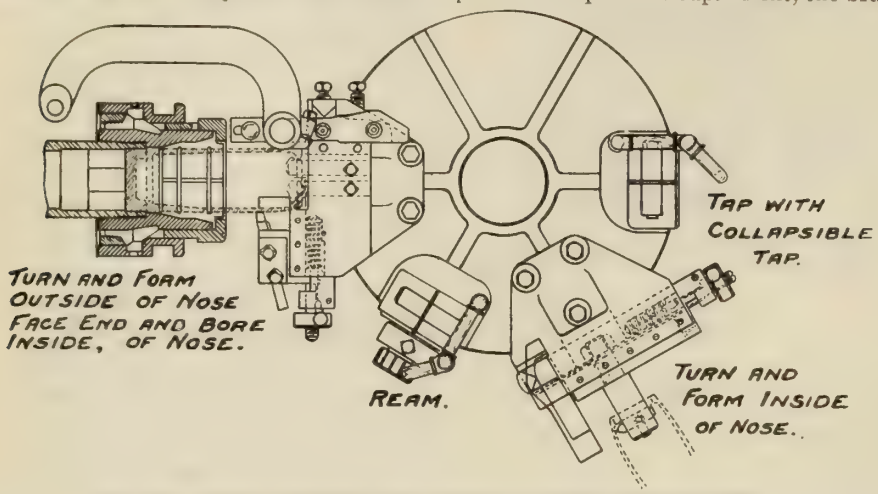

FIG. 19. THIRD SERIES OF TURRET LATHE OPERATIONS.

"V"—Table for putting in plug centres.

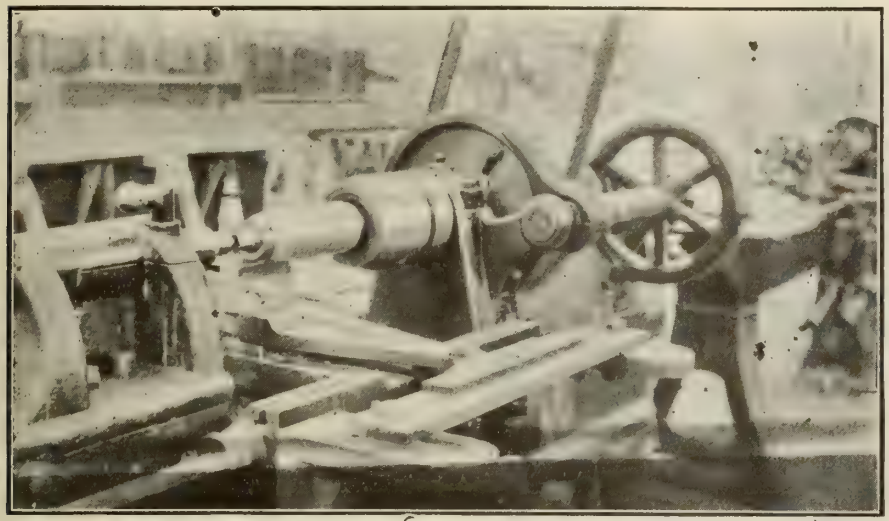
The shell is next placed in a vise and clamped tightly. An iron plug is screwed in the brass socket and a Stillson wrench is used to screw the brass socket home. A piece of pipe is usually put on the end of the Stillson, and the operator



FINISH TURNING ON ENGINE LATHE.

walks around the vise and has at his disposal about 36" of leverage. This will give one an idea of how tightly the sockets are screwed home. The idea of inserting the iron plug in the top of the brass socket is to prevent the brass from becoming distorted by the excessive strain put upon it with such a leverage. The brass sockets are received partially machined from the Canadian General Electric Co. and the James Robertson

GENERAL VIEW OF SHELL SHOP.

Co., and these are shown in Fig. 11 as they come from these firms.

As the brass socket is screwed home, the little brass powder tube enters and passes through the socket central hole, projecting through slightly when the socket is in place. A little aluminum plug is placed in the end of the tube and a bit of wire solder bent in a circle is placed over the projecting end of the brass tube. A special type of soldering iron is used to solder the brass tube to the brass socket. This operation is rapidly done because the solder is cut and bent in circles in large quantities before being sent to the assembling tables.

After the soldering operation, the aluminum plug is withdrawn and a bit of cotton waste inserted in the brass tube to keep dirt and chips out of the tube and powder tin. Four men in this department have dealt with 653 shells in 10½ hours.

### Finishing Brass Sockets.

This operation is carried out on engine lathes. The bottom of the socket is faced and the brass tube cut off flush. Next, the outside is turned and formed. Gauges are furnished to test the correctness of the profile and the depth of the recess in the socket. These gauges are shown in Figs. 22 and 23 respectively. The best production to date has been 211 in 11½ hours for one man.

### Final Operations.

The shell is brought back to the assembling benches again and a tap is run into the brass thread to clean it out. Next the waste in the brass powder tube is removed and a rod is inserted to see if the tube is absolutely clear for its full length. The shells pass through here to the final Government inspection, proceeding thereafter to the painting tables.

FIG. 21. COPPER BAND PROFILE GAUGE.

These tables are arranged as shown in Group Fig. 1, the little iron rods projecting through enter the powder tube, and as the operator paints the shell he spins it around these rods. It has been found

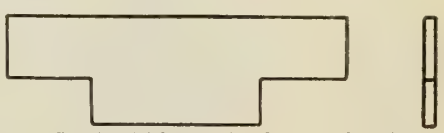


FIG. 22. SOCKET PROFILE GAUGE.

that the painters can do excellent work with this simple apparatus to assist them. The priming coat consists of black japan, and then the shell is placed in a heated cupboard to dry. A final coat of grey is applied and the nose is painted

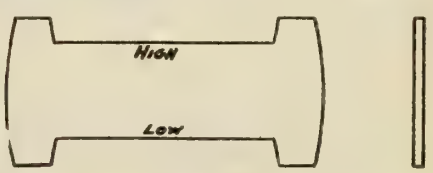

FIG. 23. SOCKET RECESS DEPTH GAUGE.

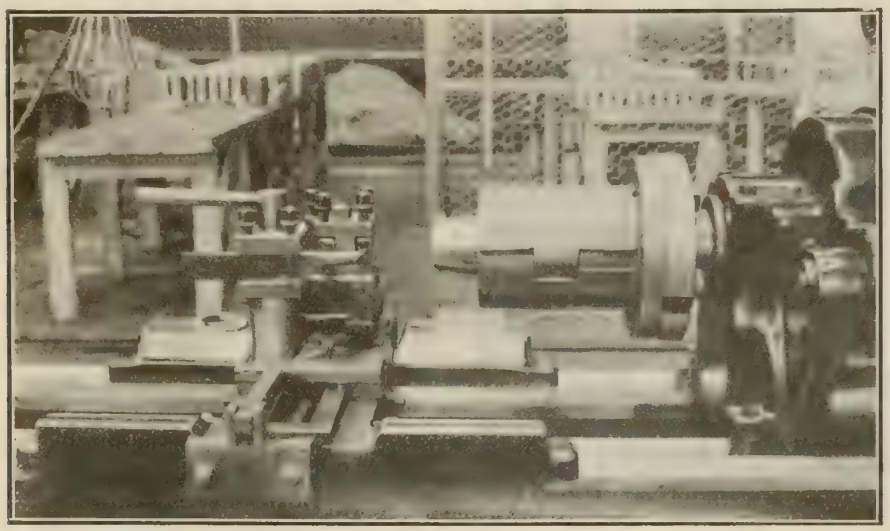
with a red lead. A brass plug is screwed fairly snugly into the brass socket to keep dirt out of the powder tube and to protect the brass from injury.

After this, the painted shell is placed on a shelf in the same cupboard to dry, and is later packed in batches of six in specially constructed wooden boxes, which are reinforced with flat iron strips. Each box is fitted with two hemp handles. The boxes are loaded into railway cars, backed on to the adjacent siding, and shipped.

### General.

The shell department has been placed in one of the large shops previously used for fabricating structural steel work. There are no definite boundaries to it, but its general dimensions are about 240

feet x 70 feet. The shells are transported from machine to machine on small trucks. Two shifts of men per 24 hour-day are worked. The day shift works ten and one-half hours while the night shift work eleven and one-half hours. Six days per week are worked. All operators of machines are on straight piece work, with the exception of the heat treatment department. The whole shop is extremely well balanced and the machines are working at an extremely high efficiency pitch, and perhaps in no other shop in Canada to-day are shells being manufactured under more ideal circumstances than in that here described. The artificial lighting is excellent, as is also the natural lighting. Ventilation has also been carefully studied. The present output is 1,500 shells per day.



FINISHING BRASS SOCKETS ON ENGINE LATHE WITH SPECIAL CHUCK AND TOOL POST.

## STEEL BLANKS OR FORGINGS DISTORTION.

ARTICLES made from steel blanks or forgings, states Alfred Herbert's Monthly Review, are frequently out of truth after the machining is finished, in spite of the fact that the machining may have been done with the greatest accuracy. Gear blanks may be distorted, crank shafts bent, holes or pins machined parallel may be no longer parallel when removed from the machine, and other inaccuracies may arise. Such troubles can only be overcome with certainty by one method—heat treatment after roughing out and before finishing. The removal of material invariably releases forces which, so to speak, have bound each other. The effect of this is often slow, and change of form does not occur until some time after the metal has been removed.

Heat treatment, if properly conducted, restores the internal equilibrium of the molecules, and the small amount of material left for finishing does not seriously affect the balance of the minute internal stresses left after heat treatment. The nature of the treatment required depends upon the material used and on the final condition required, and it ranges from simple annealing to delicate tempering processes. Care must be taken to ensure that the heat treatment does not introduce fresh internal stresses.

## ALTERNATING CURRENT FOR ARC WELDING.

IN the "question and answers" section of the General Electric Review the following question appears: "Attempts have been made by a steel foundry to fill holes in steel castings by using alternating current for arc welding, but the welds produced have been unsatisfactory. The energy was supplied from a 50 cycle, 440-60-volt, 25-kilowatt single-phase transformer, and the welding current has raised from 100 to 400 amperes. Is failure due to the fact that alternating current was used? If not, wherein is the apparatus unsatisfactory?"

In reply one of the company's engineers says: "We would attribute the lack of success to the use of alternating current. Attempts have been made to utilize alternating current for arc welding, but, as far as we know, all of them were practically failures. . . . The best equipment would be a flat-compound wound direct-current generator driven by a constant speed induction motor., the motor to have an automatic control device for regulating the amount of current drawn from the line and for preventing injury to the generator when starting the arc."

## MANUFACTURE OF CHARCOAL.

THE British Board of Agriculture has issued an interesting leaflet dealing with the manufacture of charcoal. It states: "In consequence of the war the demand for charcoal, both for heating purposes and for ammunition, has already greatly increased, and it is probable that it will remain high as long as hostilities continue. There is no difficulty in manufacturing charcoal in kilns; the initial expenditure is small, and the amount of skilled labor required is not very great, while wood which might not otherwise be utilized is turned to account. It would be unwise, however, to attempt to make charcoal without some skilled labor, and, although it has been found possible in an emergency to employ twenty to thirty unskilled men under a skilled charcoal-burner and a good foreman, there are some operations which only a trained and experienced man can efficiently perform."

Details are given of the site for the kiln, the covering and firing of the kiln, regulation of the burning, opening the kiln, and the yield of charcoal.

## BRASS TRADE OPPORTUNITITS.

ITALY, in 1912, took £408,500 worth of brass and brassware from Germany. Norway and Sweden together took £274,600 worth, and the United States of America took £146,200 worth. Then there are the valuable South American markets, such as Argentina, to which Germany sent brass goods to the value of £165,000; Brazil, which accounted for £112,700 worth; Chili, which took £49,500 worth, and Uruguay, which was a customer to the extent of £24,000. Austria's exports, too, although much smaller than those of Germany, are worthy of notice, amounting as they did last year to £1,057,750. Her principal markets were: The United Kingdom, £88,700; British India, £36,600; Russia, £98,700; Italy, £90,400; Roumania, £79,000; Turkey, £37,700; France, £26,300; and Argentina and Brazil, £16,800. In all these markets our manufacturers have such opportunities as they never had before for capturing Austria's brass trade.

**Soldering.** — It often happens when soldering with killed spirits as a fluid, that the latter cannot be applied thick enough to insure a good joint. Add some starch to the killed spirit, and boil the mixture, so as to make a sort of syrup, and you will find that you can make a far stronger job than otherwise, especially when soldering up tins which have to withstand pressure from within, such as preserve tins. The starch is, of course, turned to charcoal; but this does not hinder in the least, and can be wiped off.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## SIX-SPINDLE AUTOMATIC SCREW MACHINE.

A SIX-SPINDLE automatic screw machine represents the latest product of the New Britain Machine Co., New Britain, Conn. The new model is designed for heavy service, accurate work and simplicity of set-up and operation. Size for size, it is claimed to be the heaviest multiple spindle machine on the market and incorporates many refinements and improved features. In consequence of its rigidity of construction, heavy cuts and coarse feeds are practicable, thereby increasing productivity. The base, forming the chip pan and oil reservoir, extends to the floor, thus dispensing with legs, while the broad foundation thus obtained, together with the greater weight of the machine, tends to prevent vibration and insure a high degree of accuracy.

Six spindles make it possible to perform a greater number of distinct operations, and on work requiring less than the maximum number of operations of which the machine is capable, the production may be considerably increased by sub-dividing the longer operations—drilling, box-tooling, etc. This, of course, reduces the time on the finished piece to a fraction of that otherwise required.

The spindles are of liberal diameter, hammer-forged from chrome-nickel steel, heat treated, hardened and ground. The spindle bearings are of liberal proportions, made of fine quality bronze bearing metal, ground straight inside and taper outside. In order to maintain accuracy of the machine, provision is made for taking up wear in the bearings without disturbing their alignment.

Ball thrust collars, provided to receive the end thrust due to tool pressure, contribute to a reduction of power required to drive the spindles. Change gears provide six rates of spindle speeds, and a separate system of change gears is provided for effecting changes in feed by varying the speed of cam shaft. The spindle cylinder, which is heavy in design, is always indexed at constant speed.

The threading spindle is driven independent of the others, and, by means of change gears, its speed can be varied to suit the requirements. The threading mechanism operates independently of tool slide, while the die is run on and off with the box tools in operation. Left-hand threads are cut by inserting an extra gear in the train which drives the threading spindle, and this reverses the motion of the spindle in threading, while cutting tools remain the same.

Indexing mechanism, patterned after the "Geneva motion," gradually accelerates the heavy cylinder at the time of indexing, and as gradually checks its motion without shock. Final accuracy in indexing is by means of an extra wide rectangular latch entering notches in the circumference of the spindle cylinder.

The tool slide is of extremely rigid construction and so designed that thrust of work is evenly balanced. The ways are large and of such length that there is no overhang. The tool slide cam is laminated similar to a leaf spring, and this patented construction permits of adjustment of one cam to all length of work within the capacity of the machine. The direction of spindle rotation being right-hand, permits the use of standard tools.

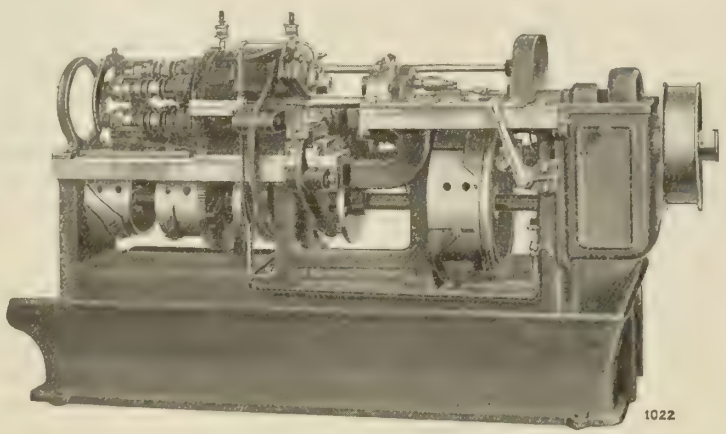
The cam shaft is driven through a large internal gear on the inner circumference of the feed cam drum, a method which tends to reduce the power necessary. Gears are machine-cut throughout, a feature of importance being the complete elimination of all chains, worm and bevel gears.

Hand control levers on each side within easy reach of the operator, enable power feed to be instantly stopped or started, these, in connection with a hand feed crank for testing all feed movements and tool positions, being essential features, as in setting up, testing and adjusting tools they save breakage.

The oil distributing system is designed to avoid as much exterior piping as possible, and this is accomplished by conveying the oil through the underside of the tool-slide into a chamber at the centre surrounding the driving shaft bushing, from which it is tapped off at the circumference through short tubes to the individual tools. The oil pump is driven at a constant speed.

That portion of the bed directly beneath the work has a 45 degree slant towards the back side of the machine, so that chips and work as cut off are carried to the side. The chip pan is widest on this side and slopes toward the rear end, where there is an oil well with strainer, from which oil is distributed to the work. This construction permits the oil to drain off before chips are removed and makes it possible to rake out the chip pan end-wise without stopping machine or removing splash apron.

The machines are designed to accommodate either belt or motor drive.



SIX-SPINDLE AUTOMATIC SCREW MACHINE.

## SAFE HAND TOOLS IN THE SHOP.

PERSONAL caution is the greatest safeguard, says Bulletin No. 19, issued by the National Founders' Association Committee on Safety, whether observed in the general and apparently important affairs of industrial life or applied to specific and seemingly trivial details. A spill from a twenty-ton ladle of molten metal may cause a serious burn, yet a chip struck from the battered head of a twenty-cent chisel may result in blindness to an employee. A defective weld in a crane chain may allow a load to "let go" with disastrous consequences, but the use of a weak, cross-grained or splintered sledge handle may let the sledge fly across the shop and injure workmen who may be in its path. Con-

siderable injury may also be traced to the use of loose-fitting wrenches, splintered or broken shovel handles and to other uncared-for hand tools.

**Tools Contributing to Injuries.**

The largest contributors to injuries in the latter class are chisels, punches, wedges, blacksmith's tools, stonecutters' tools and similar small hand tools which are subjected to frequent hammer-blows, in consequence of which their heads become readily "mushroomed." A mushroomed head presents a dangerous condition, for the next hammer-blow may break off one of the slivers of steel hanging to the body of the tool and send it flying through the air, with great risk of injury to the man handling the tool or to others nearby. The remedy costs little, is well known, simple and effective. When the head of such a tool is found to be chipped, cracked or mushroomed, it should be promptly laid aside and not used again until the head has been ground down or dressed to its proper shape.

A good practice applicable to cold-chisels and other tools that must be sharpened frequently is to grind down their heads every time the tools are sharpened, thus preventing the development of a mushroomed condition, at the same time retaining the hammer-hardened ends which will not spread so rapidly in the future life of the tools; this practice also avoids much waste of the steel which would otherwise have to be cut off if the heads of the tools were re-forged.

As a further precautionary measure, all steel hand tools that are liable to be struck by hand hammers or sledges should have the upper part of the shanks shaped round and slightly tapered from the top downward before they are used at all; care should also be taken to make such tools of the right grade of steel, else the battered, over-hanging portions of the tools will readily break off. The heads of chisels used in pneumatic tools are usually hardened and will chip very easily when struck with an ordinary hammer; such chisels should never be used in this way.

**Hammer and Sledge Handles.**

The character of hammer and sledge handles and their method of fastening is worthy of more than passing notice. If not straight-grained, or if the wood used is "short" in texture, it must be expected that such handles will quickly splinter and break. If attached in a slipshod manner, or if insecurely fitted, or if wedged by nails instead of wedges, or if the handle is water-soaked so as to swell and become only temporarily tight in the hammer head, it is obvious that these ill-fitted handles will become loose, and that the hammers or sledges will fly off when the nails loosen up or when the handle dries and shrinks. When it is recognized that the peculiar function of hammers and sledges is to strike blows with considerable force, it becomes clear that there is no economy in cheap but weak handles, and that all handles should be carefully purchased and properly fastened in place.

**COMING CONVENTIONS.**

**National Association of Manufacturers, Waldorf-Astoria, New York.—May 18-19.**

**National Machine Tool Builders' Association, Atlantic City, N.J.—May 20-21.**

**Master Boiler Makers' Association, Chicago, Ill.—May 26-28.**

**American Iron, Steel and Heavy Hardware Association, St. Francis Hotel, San Francisco, Cal.—May 25-28.**

**American Supply and Machinery Manufacturers' Association and National Supply and Machinery Dealers' Association, Hotel Bellevue-Stratford, Philadelphia, Pa. (Joint convention.)—June 3-5.**

**American Railway Master Mechanics' Association, Atlantic City, N.J.—June 9-11.**

**Railway Supply Manufacturers' Association. Convention and exhibit in conjunction with the Railway Master Mechanics and the Master Car Builders.—June 9-16.**

**Master Car Builders' Association, Atlantic City, N.J.—June 14-16.**

**American Society of Mechanical Engineers, Buffalo, N.Y. (Spring meeting.)—June 22-26.**

**American Society for Testing Materials, Hotel Traymore, Atlantic City, N.J.—June 22-26.**

**American Foundrymen's Association, Atlantic City, N.J.—Sept. 27-Oct. 1.**

**Foundry and Machine Exhibition Co., Atlantic City, N.J.—Sept. 25-Oct. 2.**

The use of defective file or screw-driver handles also contributes to the sum of injuries caused by hand tools. When such handles are split, the handle end of the file or screw-driver is apt to be forced through the handle and puncture the user's hands, and when these tools are used without handles similar injuries sometimes result. The use of only the best handles is a safe as well as an economical measure.

When smooth-faced hammers or hatchets are used for driving nails, the nails frequently glance and strike persons who are working in the vicinity. This danger can be minimized by the use of hammers or hatchets with their faces roughened.

**Wrenches.**

Wrenches are wrongly used and abused, sometimes because the management is over-economical, but usually because the employee is too lazy or impatient to secure the right wrenches for the job in hand. Solid wrenches that are too large for the nut or bolt-head are soon worn into a rounded shape that allows them to slip and bruise the workmen's hands, also spoiling the shape of the nut or bolt-head, which in turn presents an added risk of the same kind. Wrenches of the right size but worn beyond the possibility of giving safe and effective service, cause similar injuries. Again the remedy is simple and even economical; the wrenches should be ground or milled to suit larger size nuts, or if there is too little stock left, they should be scrapped. Monkey-wrenches or Stillson wrenches with bent jaws or worn adjusting parts, are also apt to cause injury by slipping; such wrenches should be repaired or replaced. Wrenches are cheap; when in good condition they are not only safest, but do more and better work than the faulty variety.

**Electrical Purpose Tools.**

The rapidly growing use of electricity for power and light requires that workmen should be instructed to use proper tools when making adjustments on electrically charged apparatus. Screw-drivers, pliers and other tools used for this purpose must be insulated. When the voltage is more than 110, insulated tongs made of hard fibre or other non-conducting material should be provided for safely removing or replacing fuses.

**General.**

Some effective system should be adopted and carefully followed in each shop to prevent the use of improper or defective handles or tools. Only such handles and tools should be purchased or put into service as are safest and best for the purpose. Even these may in time become unsafe by wear; it therefore becomes imperative that they should be inspected regularly and their safe condition maintained. In shops where such tools are turned into the tool-room or stock-room every night, the storekeepers can be instructed to issue only such tools again as are safely fit for service.

## SHELL PLANTS AND THE WAR DURATION.

THE uncertainty as to the duration of the war seems to have had a great deal to do with the character of the preparations made by nearly all of our plants manufacturing shells. Study of many of the shops engaged in the work reveals the installation of a very large number of the most ingenious and creditable arrangements and devices whose sole purpose is to get around the purchase of new equipment or the disarrangement of the original plant. In a word, the shell business has been extremely prolific in ways and means for getting the most out of standard equipment; in fact, it is certain that no one influence has had or could have a greater effect upon the future design and methods of using standard machine tools in Canada than this unexpected work. Not only have numerous possibilities of the machine tool been brought to light, but the shops generally have been affected somewhat in the same way. Manufacturing concerns have found ways of increasing their capacity, while many jobbing plants, for the time being at least, are turning out duplicate work of a satisfactory quality and at an acceptable price.

The determination of many metal working plants not to make special preparation for the shell work but to do what they can with present layouts does not seem to be altogether justifiable in the light of present experience, for while it may not be considered advisable to invest a large amount of money in special equipment, a re-arrangement of existing machines could be very profitably and economically made. Moving of machines and appliances can be done at inconsiderable expense, particularly when these are motor driven and where suitable cranes are already provided.

In many plants there seems to be a fixed rule that furnaces, oil tanks, etc., cannot be set up in the same room or building as machine tools and assembling operations, therefore much time and labor is expended in the transportation of shells back and forth. With oil or gas furnaces and lead bath, the arrangement of the heat treating department in its proper place in the most direct path of the shells has been proved to be not only feasible, but highly satisfactory.

The plant which prepares for a six months' run on shells cannot be regarded as taking a sporting chance in any sense. Lord Kitchener has been making preparation for a three-year's war from the first, and it is hardly likely that this, greatest of all wars, will be the shortest in duration of any of the more recent international struggles. Plants which assumed this view when inaugurating the business, have already made good and thus will have a tremendous advantage over others throughout the remainder of what has already come to be known as the shell period, and it is more than likely that in the end, the highly specialized plant will more than come to its own.

## THE STATUS OF ENGINEERING.

SEVERAL articles have appeared of late in this and other technical journals pertaining to the relative financial worth of the engineering business. The question, like many others, can be answered in both a general and a particular way, either of which, naturally gives rise to much variation of opinion. Generally speaking, "engineering does pay." The field for self-improvement and advancement is greater than that attached to any other profession.

The average junior mechanic has considerable spare time but, on account of long shifts and the necessity of strenuous work at times, is not inclined to devote his spare moments to physics and geometry or to education which he can sell for money later on. His work and surroundings are such that it requires an extra effort on his part to keep his personal appearance such that he can freely associate with his superiors and those who control his personal and material advancement.

The dissatisfied machinist often forgets that, in many cases, he has the making of his own surroundings and that these surroundings again react on himself.

The engineering business does pay in that the fruits of energetic and aggressive self-improvement and personal work are greater, not only in a financial sense, but the results being ever attainable, are a monumental inspiration to further achievement.

# SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., May 4, 1915.**—Industrial conditions continue to improve gradually, being stimulated by the seasonable weather. Navigation has opened on the St. Lawrence, and considerable activity is noticeable around the harbor and canal. A shortage of tonnage this season will no doubt be felt in shipping circles, although the volume of export trade will probably be above normal on account of the heavy demand by the Allies for foodstuffs and the shipment of large quantities of war material being made in Canada. An interesting trade development is announced in the inauguration of a line of steamers sailing between here and Archangel, Russia. The first boat, the Czaritza, sails from this port on May 22nd. Considerable interest has been aroused in railway circles over the announcement that the Government will operate the Eastern section of the N. T. R.

#### Steel Market.

The shell industry continues to be the most interesting feature in the steel trade. The demand for shell forgings and rounds is increasing, and the mills are working to capacity to fill all requirements. The Dominion Steel Corporation and Nova Scotia Steel & Coal

Co. are understood to be very busy on war orders outside of the shell business. The demand for structural shapes is light, as the building trade is dull, the permits issued showing a heavy decrease over last year. The demand for tool steel is improving, principally for the higher grades for machining shells.

### Pig Iron.

The market is stagnant and demand for pig iron very dull. It is reported that a considerable amount of Canadian pig iron will be shipped from this port during the season to manufacturing interests in England.

### Machine Tools.

The outlook in the machine tool trade continues satisfactory, although the difficulty in getting quick delivery of machines is causing considerable anxiety. Further orders for shells have been distributed among machine shops in this province. The Canadian Car & Foundry Co. have sub-let part of their Russian contract to the Montreal Ammunition Co., Lachine; the Lauzon Engineering Co., Levis, and the Lachine Mfg. Co. This business is, of course, additional to the orders placed by the Shell Committee. The supply business is improving, the volume of orders keeping up, but in smaller lots than usual.

### Metals.

The outstanding features in the metal markets are the extraordinary advance of antimony and the strength of the copper and spelter markets. The volume of business is improving, but buying is still hand-to-mouth, apart from the demand for metals for ammunition.

The tin market is easier and the situation has improved as regards the New York market. Tin has declined 2c, and is quoted locally at 48c per pound. The copper market is very strong and advancing, being quoted at 21c per pound. Lead is quiet and dull, with prices unchanged at 5½c per pound. The spelter market is unsettled, and prices are nominal. Spelter is scarce and demand greater than supply. Spelter has advanced 3½c, and is quoted at 16c per pound, which is entirely nominal. The antimony market is very strong and advancing. There is a heavy demand for this metal for munitions, and supplies are scarce. The price is nominal at 29c per pound. Aluminum is unchanged at 23c per pound.

---

**Toronto, Ont., May 4, 1915.**—The general business situation shows some improvement and the seasonable weather is having a beneficial effect on trade. Crop conditions are very favorable and farming operations well advanced, which has helped to create a more optimistic spirit throughout the country. The recent reverse suffered by the Allies has had a depressing effect in business circles on account of the heavy casualties, but it has also helped to a more complete realization of the severe character of the war and the extent to which this country is involved in the conflict. There are, however, no signs of discouragement, but rather a greater feeling of determination to see the thing through to a successful conclusion.

The shell industry continues to develop and more orders have recently been distributed; every machine shop in the country will soon be engaged in turning out either shrapnel or high explosive shells. The steel trade is showing some improvement, due principally to war orders. The financial situation is easier, but collections are slow.

### Steel Trade.

There are signs of increasing activity in the steel trade due largely to the shell industry and other war orders. The demand for shrapnel forgings is greater that Canadian mills can supply and it is understood that orders have been placed

> **"Unless the whole nation works with us and for us in supplying the necessary arms, ammunition and equipment, successful operations in the various parts of the world in which we are engaged will be very seriously hampered and delayed."**
> **—Lord Kitchener.**

in Cleveland, Ohio, for forgings to be machined in Canada. Manufacturing interests are also using more steel but the building trade, on the other hand, is quiet. Prices are firm and unchanged.

The outlook in the steel trade in the States is improving. The railroads are buying more freely, and further large orders for shells for the Allies have been placed recently. Ferro-manganese shipments from England have been received, subject, however, to certain conditions.

### Pig Iron.

The market continues dull with light demand. It is reported that a considerable quantity of Canadian pig iron will be shipped to the Old Country this season.

### Machine Tools.

The situation is practically the same as last week, deliveries being slow and consequently business is being held up. Several orders for shells have recently been placed with Western concerns and also more Eastern firms are now preparing to handle the business. Inquiries for machine tools are being received by dealers, who are filling orders as fast as circumstances will permit. There is a big demand for shell machinery in the States as well as in Canada and machine tool makers are working to capacity to meet the situation. Tools for ordinary purposes are moving slowly and the demand for woodworking machinery is light.

### Metal Market.

Business continues to gradually improve, largely on account of the demand for metals for ammunition. Ordinary business, on the other hand, is slow although the outlook is better. The feature of the market this week has been the strength of copper, which continues to advance. The tin market is easier and declining, but spelter is strong and advancing. Antimony is higher with the market very strong.

**Tin.**—The market is dull and easier with spot price irregular. The situation has improved as regards the New York market, the British Government having modified the restrictions placed on the export of tin to the States. Visible supplies are increasing and the market is lower. Tin is quoted at 48c per pound, being a decline of 2c.

**Copper.**—The market is strong on heavy demand for ammunition. The present high price of copper has resulted in the resumption of all the high cost producers and there is every probability that there will soon be an unprecedented production. What effect this will have on the market remains to be seen. Copper has advanced 1½c, and is quoted at 21c per pound.

**Spelter.**—The situation is unchanged and the market continues to advance. The great strength of the market is due to the fact that the demand is greater than the supply. Producers are sold ahead to such an extent that urgent requirements cannot be covered. Spelter has advanced 2c and quotations are nominal at 15c per pound.

**Lead.**—The market is quiet and easy, quotations are unchanged at 5¾c per pound.

**Antimony.**—Heavy buying continues and the market is very strong. There is just as heavy a demand for futures as for prompt delivery, so prices are bound to go higher. Antimony has advanced 5c and quotations are nominal at 35c per pound.

**Aluminum.** The market is unchanged at 23½c per pound.

## EQUIPMENT FOR AUSTRALIAN RAILWAYS.

TENDER forms, specifications and indents have been forwarded by D. H. Ross, Trade Commissioner at Melbourne, for equipment required by the Victorian and New South Wales railways. These tender forms have not yet come to hand but when received they may be inspected by interested Canadian manufacturers at the Department of Trade and Com-

merce, Ottawa. (Refer File No. 1435.) Particulars of the requirements, together with the date on which the tenders close at Melbourne, are briefly outlined thus:

**Victorian State Railways, Melbourne.**

No. 28,737. June 30, 1915—1-13-inch centre lathe.

No. 28,760. June 30, 1915—1-9 k.w. motor generator, with switchboard and accessories.

No. 28,771. June 30, 1915—1-7 h.p. electric motor and accessories.

No. 28,771. June 30, 1915—1-4 h.p. electric motor and accessories.

No. 28,771. June 30, 1915—1-3 h.p. electric motor and accessories.

No. 28,771. June 30, 1915—1-½ h.p. electric motor and accessories.

The departure of mails from San Francisco are indicated thus: From San Francisco—May 26, due Melbourne June 23. From San Francisco—June 8, due Melbourne June 29.

## CANADIAN TRADE.

THE statement of Canadian trade, issued on April 27, shows a grand total for the fiscal year of $1,078,173,240, as compared with $1,112,562,107 for the previous year, a particularly good showing in view of the dislocation of the world's trade by the war, and the unfavorable economic conditions which prevailed before the war.

In the last month of the year a very decided improvement was noticeable, the trade total being $110,540,998, as against $92,887,053 in March, 1914.

Imports for the year amounted to $587,364,363, and domestic exports to $409,419,503. In 1914 the imports were $633,564, and the domestic exports, $431,589,658.

March imports, which were $54,520,229 in 1914, declined to $40,858,179 in 1915, but the exports of domestic products showed a marked increase, the figures being $26,701,026 in 1914, and $45,118,922 in 1915. Imports of coin and bullion for the year were $131,992,922, as against $15,235,305 in 1914.

The statement is particularly interesting in its reference to exports for the month of March, exports of manufactures having increased from $6,239,290 to $15,600,790, agriculture from $6,512,346 to $12,438,145, and animals and animal products from $3,202,060 to $5,471,249.

## WAR MATERIAL REQUIRED.

A LETTER has been sent to James Day of the firm of Day, Ferguson & O'Sullivan, barristers, Toronto, by W. H. Pauling Emerich, 26 Ave. de l'Opera, Paris, in which he states that he is in the market for large quantities of war material.

Mr. Emmerich impresses that the matter of supplies of guns and cartridges is urgent, as it is said the American Government may prepare for difficulties in the Pacific and in that case the export of arms may be stopped, the Government requisitioning everything. The writer states that he has a deposit in the bank of a million francs as guarantee for provisional contracts, and as soon as he has offers, the buyers will sign provisional contract and give the sellers five or six days to put up a bond in the sum of 5 per cent. of the deal guaranteeing execution of contract. The bank holding guarantee bond in New York will confirm deposit to Lloyds, Paris, and the buyer will sign contract, make deposit of 10 per cent. in cash and give bank credit for total of the amount of the contract. Prices to be quoted f.o.b. New York, and deliveries will be accepted in New York and goods paid for against documents.

Mr. Emerich goes on to say that "my people will buy all the guns and all the cartridges you can offer for delivery monthly from April 15 to end of September. The guns should run 50 to 90,000 per month and the cartridges one to three million a day. It is understood in making your offer you guarantee the guns and cartridges to conform to specifications of country buying. They must be sold by neutral or allied citizens, and here we demand guarantee they are for allied or neutral governments.

My buyers here are financial groups who buy in their own name, put up money and security and sell to governments. Your sellers must bill at price indicated by us and agree to pay difference to parties indicated by us." List of guns, cartridges, etc., is enclosed with cable explanation to be used. All the explosives that can be secured for quick delivery can also be used at once. The code and telegraphic instructions will be at their disposal in Mr. Day's office.

### MANUFACTURE OF ARMAMENTS.

**The importance of the supply of armaments was set forth very frankly by Lord Kitchener in the British House of Commons recently, when he said it was absolutely essential not only that the arrears in the deliveries of our munitions of war should be wiped off, but that the output of every round of ammunition was of the utmost importance. He made what will be regarded as a classic statement when he went on to say:—**

**I feel strongly that the men working long hours in the shops by day and by night, week in and week out, are doing their duty for their King and country in a like manner with those who have joined the Army for active service in the field. They are thus taking their part in the war and displaying the patriotism that has been so manifestly shown by the nation in all ranks, and I am glad to be able to state that his Majesty has approved that where service in this great work of supplying the munitions of war has been thoroughly, loyally, and continuously rendered, the award of a medal will be granted on the successful termination of the war.**

## WOULD STOP U.S. SHELL SHIPMENTS.

A COMPLAINT was filed on April 29, under the so-called "discovery" statute of Wisconsin to secure information to determine whether the Allis-Chalmers Co., a corporation, Otto Falk, its president, and others have entered into a conspiracy with the Bethlehem Steel Co., and others not yet known, to manufacture and ship shrapnel shells to European belligerents, contrary to the Wisconsin law.

The complaint was filed by Samuel Pearson, who declares he is a citizen of the United States and that he has valuable property interests located within the boundaries of the German Empire; that he is owner of securities issued by the German Government; and that the German Government is and for some time past has been engaged in war with Great Britain, France, Serbia, Montenegro, Russia and Japan.

The complaint sets forth that it is the belief that the defendants have entered into an unlawful conspiracy with the Bethlehem Steel Co. and others, and that such conspiracy indicated is made a criminal offence under the laws of Wisconsin, the penalties for which are defined in the Wisconsin statutes.

The complaint states that one type of ammunition indispensable to the belligerents is a projectile known as the shrapnel shell, designed but for one purpose, the destruction of human life and property, and that the intent of the war now being conducted by the several countries named against the German Empire is so to cripple the said empire by destruction of the lives of its citizens and of its property. A hearing has been set for May 5.

## MADE-IN-CANADA CAMPAIGN.

A COMMITTEE of the Canadian Manufacturers' Association is endeavoring to raise money to advertise Made-in-Canada goods. In theory the proposal is excellent but in practice is it really wise? Most

Canadian manufacturers take a pride in their products, put their names on them and turn out something that is equal to and in not a few cases superior to anything of the kind produced in the world. On the other hand there are some Canadian manufacturers who unfortunately think their own interests are best served by making the cheapest and most inferior article they can force upon the buying public. They think a slightly greater immediate profit is better than building up a reputation for high-grade goods. These experiences and the exposures in connection with inferior qualities supplied to fill war orders show that there are some Canadian manufacturers who ought to be heartily ashamed of themselves and to be reckoned unworthy of patronage.

Even members of the committee recognize this weakness. Only the other day one of them placed an order amounting to several thousand dollars with a United States firm though the same products are made by another member of the association in a near-by town. The first manufacturer would much prefer to buy Canadian make but he knows from costly experience that his neighbor is too indifferent to take pains and turn out a satisfactory quality.

A general campaign of advertising Made-in-Canada goods would be paid for largely by the firms who are making high-grade goods, while the benefit of such a general campaign would be derived chiefly by the men who are trading on Made-in-Canada reputation and producing inferior goods to sell at slightly lower prices.

The committee of the Canadian Manufacturers' Association would be far better occupied and could do more real good to our various industries if they were to devote their energies to improving the quality—by moral and other influences—of the goods produced by their confreres who now injure the good name of Canadian manufacturers generally.

Canadian manufacturers who produce an article of which they are proud, behind which they will stand, should let the public know of it. They should advertise it extensively over their own names and not pay and be sponsors for the firms who have no care for their own or our national reputation.

## "REMEMBER THE SABBATH DAY!"

AS to total prohibition, says an Old Country exchange, it seems to be now out of court—even as applied to war munition areas. Indeed, there is a growing disposition to question whether too much of the fall in output has not been attributed to the drinking customs of a minority of the workers and too little to the growing fatigue consequent on long spells of work at high pressure. In this connection, Lord Inverclyde has suggested the abandonment of Sunday labor so that the output of the other six days of the week might be improved. His lordship is evidently one of those who realize that the Fourth Commandment means more than the average Sabbatarian thinks it does, and that its wise observance is necessary to even the physical well-being of the race.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

## CANADIAN TRADE COMMISSIONERS.

**Argentine Republic.**

H. R. Poussette, 278 Balcarce, Buenos Aires. Cable Address, Canadian.

**Australasia.**

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

## Engineering

**Calgary, Alta.** — The Calgary Ironworks will manufacture shells.

**Brantford, Ont.**—The Waterous Engine Works have received an order for shells.

**Lethbridge, Alta.**—G. Kischel has leased the Lethbridge Iron Works, and will run the plant as formerly.

**Zurich, Ont.**—It is proposed to install a fire protection system. A tank will be required, also a gasoline engine and pump.

**Moose Jaw, Sask.**—The Saskatchewan Bridge & Ironworks, Ltd., have received a contract for 50,000 shells. G. E. McClellan is president of the company.

**Charlottetown, P. E. I.**—The Bruce-Stewart Co. have started to rebuild their foundry which was destroyed by fire recently. Lowe Bros. are the contractors.

**Toronto, Ont.**—G. B. McGregor, of the Ford Motor Co., states that the company propose to establish plants at Winnipeg and Calgary, and possibly at Vancouver.

**New Westminster, B.C.**—The Heaps Engineering Co., which recently went into liquidation, has received an order for shells. An effort is being made to reorganize the concern.

**Vancouver, B.C.**—Orders for shells have been distributed among the following: Vancouver Engineering Works, the Terminal City Iron Works, Ross & Howard, Letson & Burpee, the Wallace Shipyards, the B. C. Marine Railway Co., the Vulcan Iron Works and the Heaps Engineering Co., of New Westminster.

## Municipal

**Parry Sound, Ont.**—Tenders are being received for a steel water tank having a capacity of 150,000 gallons.

**Stratford, Ont.**—Council will have a by-law prepared to authorize the borrowing of $50,000 to erect a water tower at the city pumping plant.

**Ridgetown, Ont.**—A by-law will be voted on by the ratepayers on May 10, to raise $12,500 to meet the cost of remodelling the present lighting system for hydro-electric power.

**Toronto, Ont.**—York Township Council are working on a plan for improving the water and sewerage systems.

**Joliette, Que.**—The town council contemplates installing a street lighting system at an estimated cost of $6,000.

**London, Ont.**—The Utilities Commission will meet on May 6, to open tenders for the new hydraulic machinery for the Springbank pumping station. M. Glaubitz is manager of the waterworks department.

**Berlin Ont.**,—The Water Commission has investigated various sources of water supply in the vicinity of this city. It has been decided to sink several wells near Bridgeport, where there are a number of natural springs.

## Electrical

**Niagara Falls, Ont.**—Work has commenced on the new ornamental street lighting system.

**Owen Sound, Ont.**—The hydro-electric high power line from Eugenia Falls generating station to Owen Sound is partly completed, eleven miles having been erected.

## General Industrial

**Port Elgin, Ont.**—The Stephens-Hepner Co. propose to extend their broom factory.

**Ridgetown, Ont.**—Fire destroyed A. S. Blight's flour mill here on April 29. The damage is estimated at $20,000, about half that amount being covered by insurance.

**Port Arthur, Ont.**—The National Elevator, owned by the National Elevator Company of Winnipeg, located on the C. N. R. tracks, was completely destroyed by fire on May 2. The plant was worth about $100,000 and insured for about $60,000.

**Deseronto, Ont.**—This town is to have a match factory conducted by the Rathbun Match Co. The capitalization is $125,000. The officers of the new company are: President and treasurer H. W. Rathbun; manager, G. G. Gardiner; secretary, L. E. S. Hodge.

**Lethbridge, Alta.**—The Ellison Milling Co., of this town, has decided to rebuild the elevator at Magrath recently destroyed by fire, together with the mills of the company which were located there. The mills will not be rebuilt. The new elevator will have a capacity of 40,000 bushels.

**Lindsay, Ont.**—It is understood that the amalgamation of the Lindsay Library & Office Fittings Co. with the Capital Office Fittings Co., of Ottawa, is practically completed, and that the Lindsay branch, which will comprise the manufacturing end of the business, will commence operations about May 1.

## Building Notes

**Mimico, Ont.**—For additions to the public school, the Village Council has passed a debenture by-law for $17,200.

**Toronto, Ont.**—The Bell Telephone Co. has secured a permit from the City Architect's Department for the erection of an exchange at North Toronto, the building to cost about $31,000.

**Toronto, Ont.**—The Toronto Hydro-Electric system has been granted a permit by the City Architect's Department to erect a two-storey brick and concrete electric power station on the south-east corner of Gerrard street and Carlaw avenue at a cost of $65,000. Tenders for the construction of the station will be received until May 13. Specifications, drawings and form of tender can be seen at the Toronto Hydro-Electric System sub-station, corner Duncan and Nelson streets.

**Toronto, Ont.**—The building operations now being carried on by the Toronto Board of Education total $1,555,000. The list includes the following new schools, additions, and annexes: Additions are being made to Leslie street school, $54,000; Regal road, $105,000; North Toronto High School, $55,000; Roden, $35,000; John Fisher, $50,000; Withrow, $50,000; Bedford Park, $28,000. Annexes are being built for: Ryerson, $60,000; Essex, $67,000; Palmerston, $58,000; Brock, $55,000; Huron, $35,000. The new buildings which are being put up are: The Administration Building, for which tenders are to be opened to-day, $100,000; Commerce High School, $280,000; Niagara, $110,000; Davisville east, $50,000; Leslie street north, $59,000; Runnymede, $57,000; Givens, $180,000; Pape avenue north, $57,000.

# Tenders

**Orillia, Ont.**—Tenders will be received until May 17, for centrifugal pumps and motors, cast iron pipe and a Venturi meter. Specifications at the office of F. Gover, sec'y-treas., Water, Light and Power Commission, Orillia.

**Transcona, Man.**—Tenders will be received up to May 15 for the supply and erection of pumps and motors, etc. Plans and specifications may be obtained from W. M. Scott, engineer, 204 Sterling Bank Building, Winnipeg, Man.

**Brockville, Ont.**—Tenders will be received up to May 17 for the construction of a mechanical filtration plant. Plans and specifications may be seen at the office of G. H. Bryson, Town Engineer.

**Toronto, Ont.**—Tenders will be received up to May 11 for the supply and installation of one sludge pump and motor for the main sewerage disposal works, Toronto. Specifications may be obtained at the Works Department, City Hall.

**Toronto, Ont.**—Tenders will be received up to May 11, for the supply of: No. 48.—Red lead paint for Bloor street viaduct; 50.—Ashphalt pump outfit for city plant, Princess street; 51.—Additional equipment for car bodies, Lansdowne avenue car line extension, Toronto Civic Railway; 52.—Car heaters and seats, Gerrard street equipment. Specifications and forms of tender may be obtained at the Works Department, City Hall.

# Trade Gossip

**The Western Foundry Co.** has increased its capital stock from $150,000 to $200,000.

**The Exolon Co.** of Welland, Ont., has received a supplementary license to use capital in Ontario to the extent of $175,000.

**Steel Co. of Canada.**—On April 29 the annual meeting of the Steel Company of Canada was held at Hamilton. All the directors were re-elected and the officers also. Charles S. Wilcox is president; Cyrus A. Birge, vice-president; and Robert Hobson, vice-president and general manager.

**The Goldie & McCulloch Co.**, Galt, Ont., have sold the following equipment to the Toronto Board of Education for the new Technical School: One 50 k.w. high-speed, horizontal, 10 in. x 12 in. centre-crank engine, and one 365 h.p. vertical, high speed compound, 15 in. and 25 in. x 10 in. engine.

**Purchasing Commission.**—The personnel of the Canadian Government Commission, which is to make all purchases under the $100,000,000 war appropriation passed at the recent session of Parliament, is announced, and consists of George Gault, Winnipeg; H. Laporte, Montreal; and A. E. Kemp, of Toronto.

**Big Contract for Cement.**—The Dominion Government has awarded the Canada Cement Company of Montreal a contract for 2,500,000 barrels of cement. Next to the contract for cement for the Panama Canal, this is the largest order ever given for this commodity. The cement will be used in Welland Canal extensions.

**Placing Big Shell Order.**—Senator Curry, president of the Canadian Car & Foundry Co., and F. A. Skelton, secretary-treasurer, have gone to New York on business in connection with the company's Russian shell order. The entire $80,000,000 order, Canadian and American end both, will probably be placed within the next few days.

**ALLIES PURCHASING AGENTS.**

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**British.—Lieut. Johnston and A. C. Billing, Ritz Carlton Hotel, Montreal.**

**French—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministeve de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**

**Russian — Messrs. S. Ruperti and Aiekieff, care Military Attache, Russian Embassy, Washington, D.C.**

**Shell Manufacture Out West.**—Professor Stansfield, head of the metallurgical faculty of McGill University; A. W. G. Wilson, chief metal engineer of the department of mines, and Mr. Carnegie, a shell expert —all three of whom are representatives in Canada of the British shell commission—have arrived in Victoria, B.C. They are making exhaustive inquiries throughout the Dominion for the purpose of determining what facilities offer for producing shells on a large scale, and they are paying particular attention to the copper, zinc and lead output of British Columbia. The party visited Trail, B.C.

**War Orders Speculation.**—Whether the war order benefits are being too liberally discounted by Stock Exchange speculation remains to be seen, yet there can be no doubt that big business is being executed. The Government committee which has been handling the shell orders for the British War Office reports that the business placed in Canada amounts to $170,000,000, which, added to the Russian orders, makes a total that cannot be too lightly regarded in relation to Canadian trade—and shells have not been the only lines in which Canadian manufacturers have benefited.

# Personal

**James Stewart**, until two years ago chief engineer of the Western Canada Flour Mills at Goderich, Ont., died at that place on April 26, aged 73.

**Capt. K. S. MacDonnell**, for several years town engineer of Barrie, Ont., is leaving shortly for the front in command of a company taken from the 37th Battalion.

**H. Osborne** has been appointed works manager of the Angus shops of the C. P. R. at Montreal. The Angus shops district has been operated as a separate unit, but will henceforth form a part of the Eastern Lines.

**C. A. Ablett**, general manager of the Siemens Company of Canada, Ltd., Montreal, has resigned and has sailed for England to obtain a commission in an English regiment. W. Hoult succeeds Mr. Ablett as general manager.

**Frank E. Mutton** has been appointed secretary and general manager of the International Time Recording Co., of Canada. For the past three years Mr. Mutton has been managing director of J. J. Gibbons, Ltd., Advertising Agents, and previously was manager of the National Cash Register Co., in Canada.

**T. H. Wardleworth**, of the National Drug & Chemical Co. of Canada, Ltd., was recently elected by acclamation, chairman of the Montreal Branch of the Canadian Manufacturers' Association, stepping up from the vice-chairmanship, which he has held for the past year. George A. Slater, of George A. Slater, Ltd., was elected vice-chairman, also by acclamation.

**J. A. Shaw** has been appointed electrical engineer of the C.P.R., according to a circular just issued by W. E. Woodhouse, the chief mechanical engineer. Mr. Shaw joined the service in 1904 as assistant electrical engineer of motive power at the Angus Shops, and in 1908 was made electrical engineer of Eastern Lines. His new appointment gives him authority over all the lines of the C.P.R. Mr. Shaw carried out the important electrical work of the new C.P.R. bridge over the canal at Lachine.

# New Incorporations

**The Seamless Rubber Co.** has been incorporated at Toronto with a capital of $40,000 to manufacture rubber goods of every kind at Toronto, Ont. Incorporators: Silas C. Williams, Edward Lindsay Middleton, of Toronto.

**The Coast and Lakes Contracting Corporation** has been licensed at Toronto with a capital of $40,000 to construct wharves, piers, docks, etc., with head office at Toronto, Ont. A. J. Russell Snow, of Toronto, is attorney.

**The Ker & Goodwin Machine Co.** has been incorporated at Ottawa with a capital of $50,000 to carry on business as machinists, etc., at Brantford, Ont. Incorporators: W. S. Brewster, George D. Heyd, of Brantford.

**The Empire Cotton Mills, Ltd.,** has been incorporated at Toronto with a capital of $40,000 to carry on the business of cotton spinners at Welland, Ont. Incorporators: James Steller Lovell, Charles Delamere Magee, of Toronto, Ont.

**Armstrong Cork & Insulation Co.** has been incorporated at Ottawa with a capital of $50,000 to manufacture cork, cork board, cork products of all kinds at Montreal, Que. Incorporators: Arthur William Patrick Buchanan, John Henry Turner, of Montreal, Que.

**The Canada Drill & Chuck Co.** has been incorporated at Ottawa with a capital of $20,000 to manufacture all kinds of machinery and tools at Toronto, Ont. Incorporators: John Lichty Wettlaufer, Hugh Sampel McHenry, of Toronto, Ont.

**The Procter & Gamble Distributing Co. of Canada, Ltd.,** has been incorporated at Ottawa with a capital of $25,000 to manufacture soap and allied products at Hamilton, Ont. Incorporators: William Cooper Procter, John Jackson, of Cincinnati, Ohio.

# Catalogues

**Automobile Supplies.**—The Nathan Novelty Manufacturing Co., New York, have issued a new catalogue dealing with an extensive line of automobile and sporting goods. The catalogue is fully illustrated.

**Drop Forgings.**—The Gotham Advertising Co., New York, are distributing a catalogue of drop forged machinists' tools made by the J. H. Williams & Co., Brooklyn, N.Y. A complete line of "Agrippa" and "Vulcan" tools are described and illustrated, while prices and essential dimensions are given for each size.

**Kerr Turbine Co.,** Wellsville, N.Y., is distributing Bulletin No. 53, entitled "Economy Exhaust Steam Turbines," which describes and illustrates typical installations and explains the conditions under which exhaust turbines can be made to produce large increase in power output practically without other expense than the cost of the turbine installation. A copy of this bulletin will be mailed upon request.

**The Output** is the title of a house organ published by the Cooper-Hewitt Electric Co., Hoboken, N.J., This is the first number, and, as would naturally be expected, is devoted to matters regarding electric lighting and Cooper-Hewitt lamps, relieved with numerous humorous contributions. We wish this enterprise success for the future.

**Sewage Apparatus.**—A new apparatus for drying sewage sludge is the subject of a booklet issued by the Patentees of the B. T. W. Machines, Tadcaster, Yorks, England. This machine, which is known as the B. T. W. dryer, is described in detail in conjunction with a drawing showing the general design. The method of operation is also dealt with fully.

**The Dearborn Chemical Co. of Canada, Ltd.,** Toronto, are distributing a bulletin describing the Dearborn treatment of boiler feed-water. The subject is dealt with in a thorough manner, and the principal features of the treatment are carefully described. Among the illustrations are included typical examples of corrosion in boiler tubes and sheets, etc.

## RECORD COPPER SHIPMENTS.

Exports of 5,853,254 pounds of copper from ten principal customs districts in the United States for week ending April 10, compare with shipments of 10,623,248 pounds in the preceding week and 22,503,362 pounds in the week of March 27.

The only shipments exceeding a million pounds in the week of April 10 were to France, 2,747,861 pounds, and England, 1,882,499 pounds.

Shipments for two weeks have been as follows:—

| | April 10. | April 3. |
|---|---|---|
| France | 2,747,861 | 2,713,523 |
| England | 1,882,499 | 6,242,436 |
| Scotland | 168,066 | ..... |
| Norway | ..... | 11,000 |
| Sweden | 448,062 | ..... |
| Netherlands | 6,141 | 331,157 |
| Italy | 558,936 | 784,796 |
| Russia | ..... | ..... |
| Canada | 11,054 | 372,087 |
| Cuba | 2,261 | 23,065 |
| Brazil | ..... | 5,328 |
| All others | 28,374 | 139,856 |
| Total | 5,853,254 | 10,623,248 |

## GOVERNMENT WILL OPERATE N. T. R.

AS the Grand Trunk Pacific has declined to take out a lease, the Government has taken over for operation the National Transcontinental Railway, eastern division, from Moncton to Winnipeg. At the same time, the Government will also take over and operate the Lake Superior division of the Grand Trunk Pacific, lying between Superior Junction and Fort William, including the terminals at the latter place. The jurisdiction of the general offices of the Canadian Government Railways will extend over these new lines, and they will take immediate charge.

The reason for the refusal of the Grand Trunk Pacific to operate the N. T. R. according to the agreement made between it and the late Government, is the enormous cost of the undertaking.

## DEVELOPMENT OF NEWFOUNDLAND.

SPEAKING for the Government in the Legislature of Newfoundland on April 22, Sir Edward Morris outlined the contract which it is proposed to make with the Newfoundland Products Corporation, Ltd., represented by Thomas L. Willson, of Woodstock, Ont., and with him associated the Reid-Newfoundland Co. The expenditure suggested is large, the items being as follows:

| | |
|---|---|
| Water power | $ 6,440,300 |
| General work | 2,564,000 |
| Industrial plant | 3,745,000 |
| Phosphoric Acid plant | 900,000 |
| Ammonia plant | 450,000 |
| Working capital | 2,000,000 |
| Railway revision | 250,000 |
| Grand total | $16,349,300 |

The company proposes to establish at Bay of Islands at a cost of about $18,000,000 an industry for the manufacture of ammonium phosphate, which is a fertilizer; ammonia, cement, wood pulp and lumber. The details are set forth as follows as regards construction and equipment:

| | |
|---|---|
| Coke and gas works | $ 799,000 |
| Lime quarry | 75,000 |
| Lime kilns for 250 tons production per day | 142,000 |
| Calcium carbide works | 462,800 |
| Carbide crushing works | 71,400 |
| Electrode carbon works | 25,000 |
| Saw mills | 211,800 |
| Sulphite pulp mills, electrolytic bleaching plant and wood preparations | 1,568,300 |
| Machine shops, iron and brass foundries, boiler and structural shops, forges, pattern shops, and storage rooms | 161,400 |
| Engineering and supervision of foregoing items | 228,300 |
| | $ 3,745,000 |

METAL STAMPINGS
We are manufacturers of stamped parts for other manufacturers.
We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.
We can finish steel stampings in Nickel, Brass or Copper.
Send us a sample order.
W. H. BANFIELD & SONS
120 Adelaide St. W., Toronto

McKaig's Combination Pliers
A new invention, an improvement over the old style. When the cutters on other pliers get dull they won't cut. "SURE CUTTERS" will cut perfectly, no matter how dull the edges get.

When the hold gets loose on other pliers, they won't cut — but "SURE CUTTERS" do the work just the same.
Try them—order now, before you forget it.
McKaig Drop Forge Company
Buffalo, N.Y.

SHEET METAL STAMPINGS
Automobile Fenders, Hoods and Gasoline Tanks
We are now manufacturing a number of lines for Canadian firms filling war contracts.
The quality of our production is one grade — THE BEST. Our facilities and equipment enable us to give a very attractive price and prompt service.

# CLUTCHES

**Combined Jaw and Friction. Friction only Gas Engine Clutches. Jaw Clutches.**

Write for interesting printed matter.

**The Positive Clutch & Pulley Works Ltd.**

MONTREAL Factory: Aurora, Ont. TORONTO

**20 TIMES THE SERVICE**

That's what this self-hardening, high-speed steel chaser does for the LANDIS DIE.

Four long cutters tangentially disposed to the work carried in suitable holders make an ideal cutting condition. This, along with its many other distinctive characteristics, has established for us a world-wide reputation.

WRITE FOR CATALOGUE NO. 21.

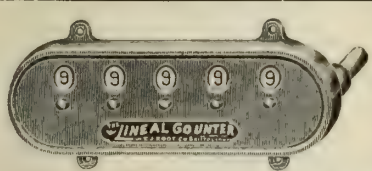
**Landis Machine Co., Waynesboro, Pa.**

Exclusive Canadian Representatives, Williams & Wilson, Montreal, Canada.

**PRESSES—ALL TYPES**

Press Attachments, Automatic.
Metal and Wire Forming Machines.
Tumblers—Large Line.
Burnishing Machines. Grinders.
Special Machines.

**Baird Machine Co., Bridgeport, Conn.**



**Detective and Stop Watch Combined.**

"We have a counter on every one of our presses, even the foot presses." This from a satisfied user of our counters. If you use presses our counters would save you money. Ask for catalog 25.

**The C. J. ROOT CO., 125 Bridge Street, Bristol, Conn.**

# NORTON JACKS

**For all kinds of heavy lifting**

Send for complete catalogue showing 50 styles 10 to 100 tons capacity.

Made only by

**A. O. NORTON, LIMITED**

Coaticook, Prov. Quebec - - Canada

**1/16 Page** $1.60 per insertion on yearly order.

# The Garvin Machine Co.

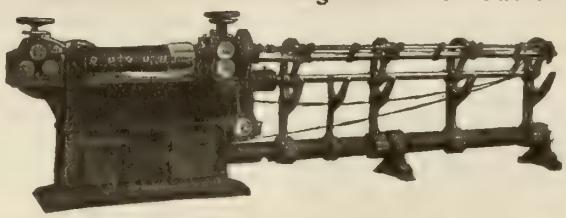
**Manufacturers of**

Milling Machines; Profiling Machines; Cam Cutting Machines; Screw Machines; Monitor Lathes; Die Slotting Machines; Screw Slotters; Tapping Machines; Duplex Horizontal Drills; Gang Drill Presses; Four-Head Right-Angle Drills; Wrenchless Chucks; Spring Coilers; Cutter Grinding Machines; Surface Grinders; Hole Grinders; Hand Lathes and Special Machinery.

**We Want All To Have Our Catalog—Send For It To-day.**

**Spring and Varick Streets, NEW YORK CITY**

**Automatic Wire Straightener and Cutter**



**PUT IT TO WORK**

cutting up those coils of wire, and let it earn its cost. Every length will be an exact duplicate of the preceding one, and all will be absolutely straight.

Costs little to run, because it requires little attention beyond placing the coils of wire.

Catalogue gives full information.

**The F. B. SHUSTER COMPANY, New Haven, Conn.**

Formerly John Adt & Son. Established 1866

Also makers of Riveting Machines, Sprue Cutters, Foot Presses, etc.

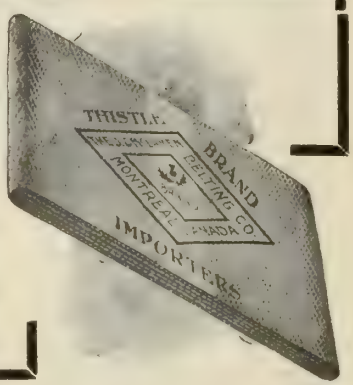
Canadian Agents: A. R. Williams Machinery Co., Toronto.

# "THISTLE" BRAND RUBBER BELTING

**"Maintenance of Quality"**

is our motto, and our experience in the manufacture of belting since the year 1856 should be invaluable to you. Let us tell you all about this friction-faced belting. The price will appeal to you

Write to-day.



**J. C. McLAREN BELTING CO., LTD.**

TORONTO, MONTREAL, WINNIPEG

# Projecting Screw Heads

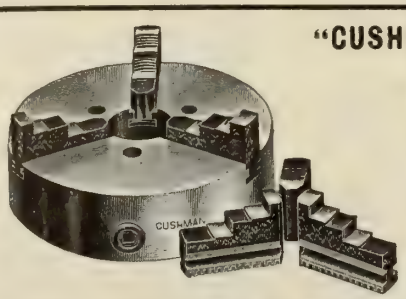
**Are Whirling Dervishes of Death**

Invisible till they get you. They are fatal to the extent of over 1,500 persons killed or maimed each year in the United States. No heads are needed with "Allen" Safety Set Screws.

Write for Circular No. 3.

**Allen Mfg. Co., Inc., St. Johns, P.Q., Canada**

**"CUSHMAN" CHUCKS**



are generally known as the "heavy pattern," being designed for hard service.

Their accuracy and reliability have been proven over and over again, and the name "Cushman" on your chuck is a guarantee of satisfaction.

Our line consists of many styles and sizes of Lathe Chucks, Drill Chucks, Centering Chucks, and Face-Plate Jaws.

Catalogue Free.

# Starrett Vernier Calipers

## Where Used

Starrett Vernier Calipers should be used by high-grade machinists and toolmakers for accurate work on all measurements where a micrometer cannot be conveniently used. They are equally accurate for outside or inside measurements, and may be used on a wider range of work than can a micrometer.

## Superiority of Graduations

In using the vernier for readings up to .001 of an inch the accuracy of the measurements depends on the graduations of the instrument. The Starrett graduations are more accurate than those obtained by any other process—they are cleaner, finer, and sharper than on other instruments. Examination under a microscope will prove this assertion. Our secret etching process produces this result.

## In Plush-Lined Cases

To keep the vernier safe from rough handling and from contact with tools or other objects which might scratch it, we furnish with each instrument a plush-lined wooden case, very attractive and a perfect protection.

## Prices

**The prices for Starrett Vernier Calipers, including cases, are as follows:**

4″—$13.00
6″— 15.00
9″— 18.00
12″— 20.00
24″— 25.00

**Send for free catalog No. 203, describing 2100 styles and sizes of fine tools.**

## Here's a Grinder that Never Needs Be Idle

Because of its greater range of work—External and Internal, Cylindrical, Surface, Disc, Cutter and Reamer Work of all description can be ground with as much accuracy and rapidity on the Bath Universal Grinding Machine as on a single purpose machine.

Changes from one operation to another can be made quickly.

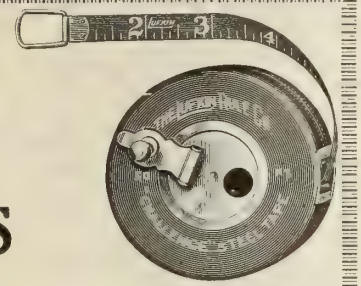
LUFKIN

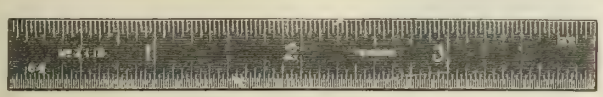


# TAPES AND RULES

## NOTED FOR ACCURACY

We make a complete line of

MACHINISTS' SCALES — MEASURING TAPES
FOLDING STEEL RULES — WOOD RULES
FOLDING BOXWOOD RULES
SPRING JOINT RULES



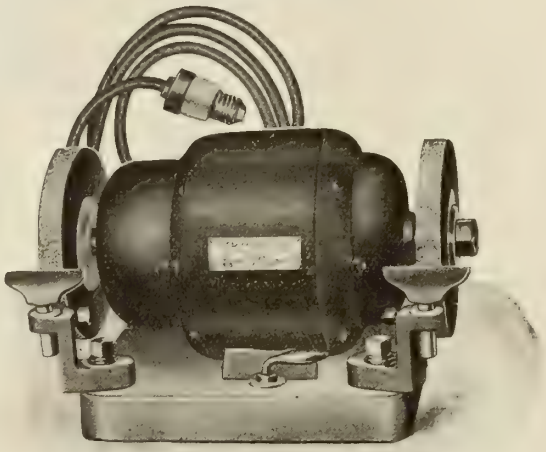
Our goods are stocked by prominent hardware and supply houses throughout the Dominion. They are fully guaranteed.

**Catalogue on request.**

THE LUFKIN RULE CO. OF CANADA, LTD.
WINDSOR, ONT.

# ELECTRIC BENCH GRINDER

**You will find it the handiest tool in your Shop!**



**We are now prepared to supply them as follows:**

No. 1, 1/6 H.P., A.C., capacity two 6 x ¾ in. Emery Wheels.
No. 2, ¼ H.P., A.C., capacity two 6 x 1 in. Emery Wheels.
No. 2, ¼ H.P., D.C., capacity two 6 x 1 in. Emery Wheels.
No. 3, ½ H.P., D.C. capacity two 8 x 1 in. Emery Wheels.
No. 4. 1 H.P., D.C., capacity two 10 x 1 in. Emery Wheels.

## STOW MFG. CO.

BINGHAMTON, N.Y., U.S.A.

Little Giant

# CYLINDRICAL LIMIT GAGES

For shell work this style of gage is most efficient and economical.

**PROMPT SHIPMENT.**

We maintain a large stock at all times.

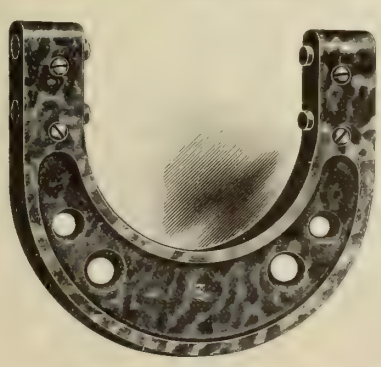
These can be shipped set to special limits specified by the customer within **48 hours** from receipt of order.

Gages set to special limits and with setting plugs can be shipped in 7 to 10 days.

**THREAD LIMIT GAGES.**

For every form and style of screw thread.

Send for our Gage Catalog.



The upper points are set in maximum limits — the lower points to minimum limits. Points can be sealed to prevent tampering.

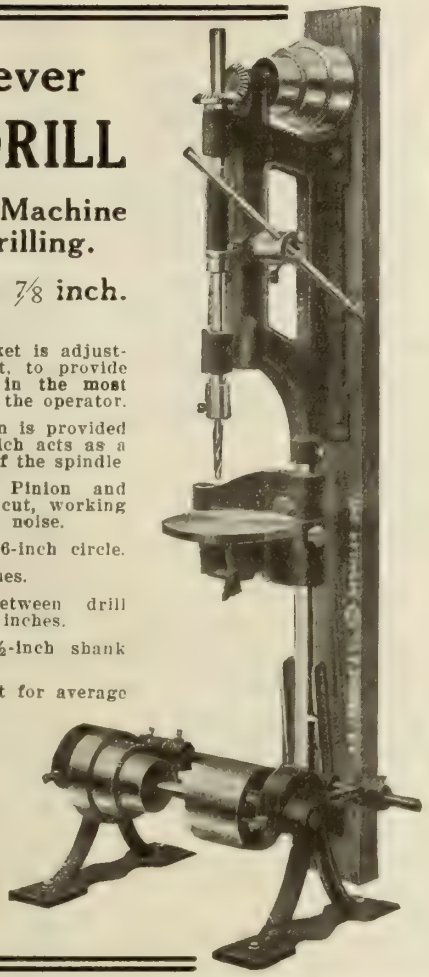
## 16 in. Lever
# POST DRILL

**A Giant Little Machine For Light Drilling.**

**Will drill up to 7/8 inch.**



The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16-inch circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½-inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

**A. B. Jardine & Co.**

**Hespeler, Ontario**

JOHNS-MANVILLE SERVICE COVERS THE CONTINENT

*Our interest in a J-M Product does not stop with the sale. Every J-M Product is backed by the resources of a nation-wide organization with over half a century's reputation for Quality and Honorable Dealing and is sold plus the assurance of a reliable Service now in actual operation in every important city of North America. This service makes the J-M Guarantee of Satisfaction an actuality wherever you may be.*

# NO SURRENDER

ought to be the axiom of every balanced mind. Primarily it is fighting phraseology where bludgeon warfare is concerned. But it has a genuine, wholesome adaptation to modern business and a recognized use where *success* is the goal of well-directed effort.

Don't loosen the business grip you have secured and allow others to reap what you have sowed. "What we have we'll hold" is synonymous language for you. Live up to it and hold on to what you've got by advertising in

# No. 2 Portable Welding Equipment

**High in Quality and Efficiency but low in price**

This outfit is designed for garages, factories, sheet metal works, boiler shops, job shops. With it cast iron, steel, copper, brass, aluminum, bronze and malleable iron are readily and successfully welded. This complete welding plant includes our regular combined welding and cutting torch, also carbon removing attachment.

WE WANT THE OPPORTUNITY OF PROVING ITS IMPORTANCE TO MODERN SHOP PRACTICE. **Your communication with us will be a few minutes of your time extraordinarily invested.**

**Includes our regular combination welding and cutting torch**

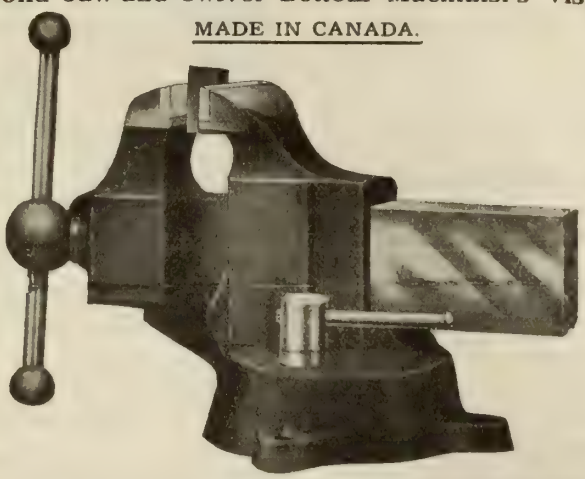
## —The YOST—

**Solid Jaw and Swivel Bottom Machinist's Vise**

MADE IN CANADA.



A vise with a grip like grim death; a durability that defies time and the hardest usage.

A vise that will give you a lifetime of perfect service and satis.action. The metal in a Yost Vise is of faultless quality, perfectly distributed and the workmanship is

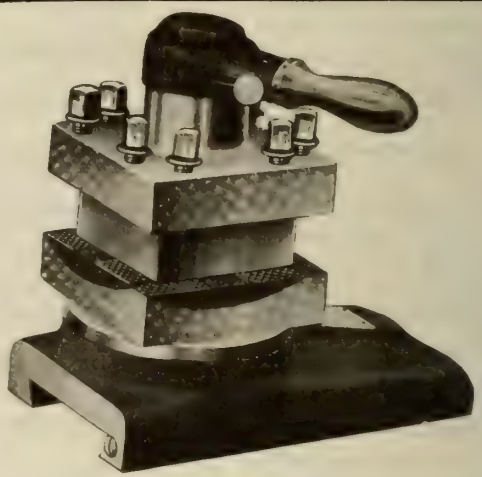
***Incomparably Good***

The National catalog would certainly interest you. Write us, asking for a copy.

**National Machinery & Supply Co., Ltd.**

HAMILTON - - ONTARIO

**This Guarantee Goes With Every Vise:** We fully guarantee all of our Vises to be satisfactory in every particular and will promptly replace, without cost, any parts broken or badly worn when such failures are due to faulty material or construction.



## Particularly Adapted to the Manufacture of Shrapnel

**Your Lathe Needs A NEW TOOL POST. One of the Modern Multiple Type.**

You can no longer afford to use the old style single tool holder.

Give us the size of the dovetail on your lathe carriage and height to lathe center; we will quote you price on a Modern Tool Holder that we guarantee will increase your production, and give you some interesting facts about Lathe Turrets.

No matter what make or size of lathe—we can fit it.

## We Saved 4½ Hours on Each of These Castings

This demonstrates the superiority of Milling Machines for this class of work.

Twelve different settings are required in milling the castings, but the facility of making these settings, and the advantages of gang milling and fast operation count in saving time. Furthermore, exact duplicate work is easily obtained by this method of gang milling.

Some work that can be done in this way: machine beds or tables, bases or frames of engines, pumps and compressors, crank cases, etc.

The 5 B Heavy Plain Milling Machine, as shown, is built for just such work.

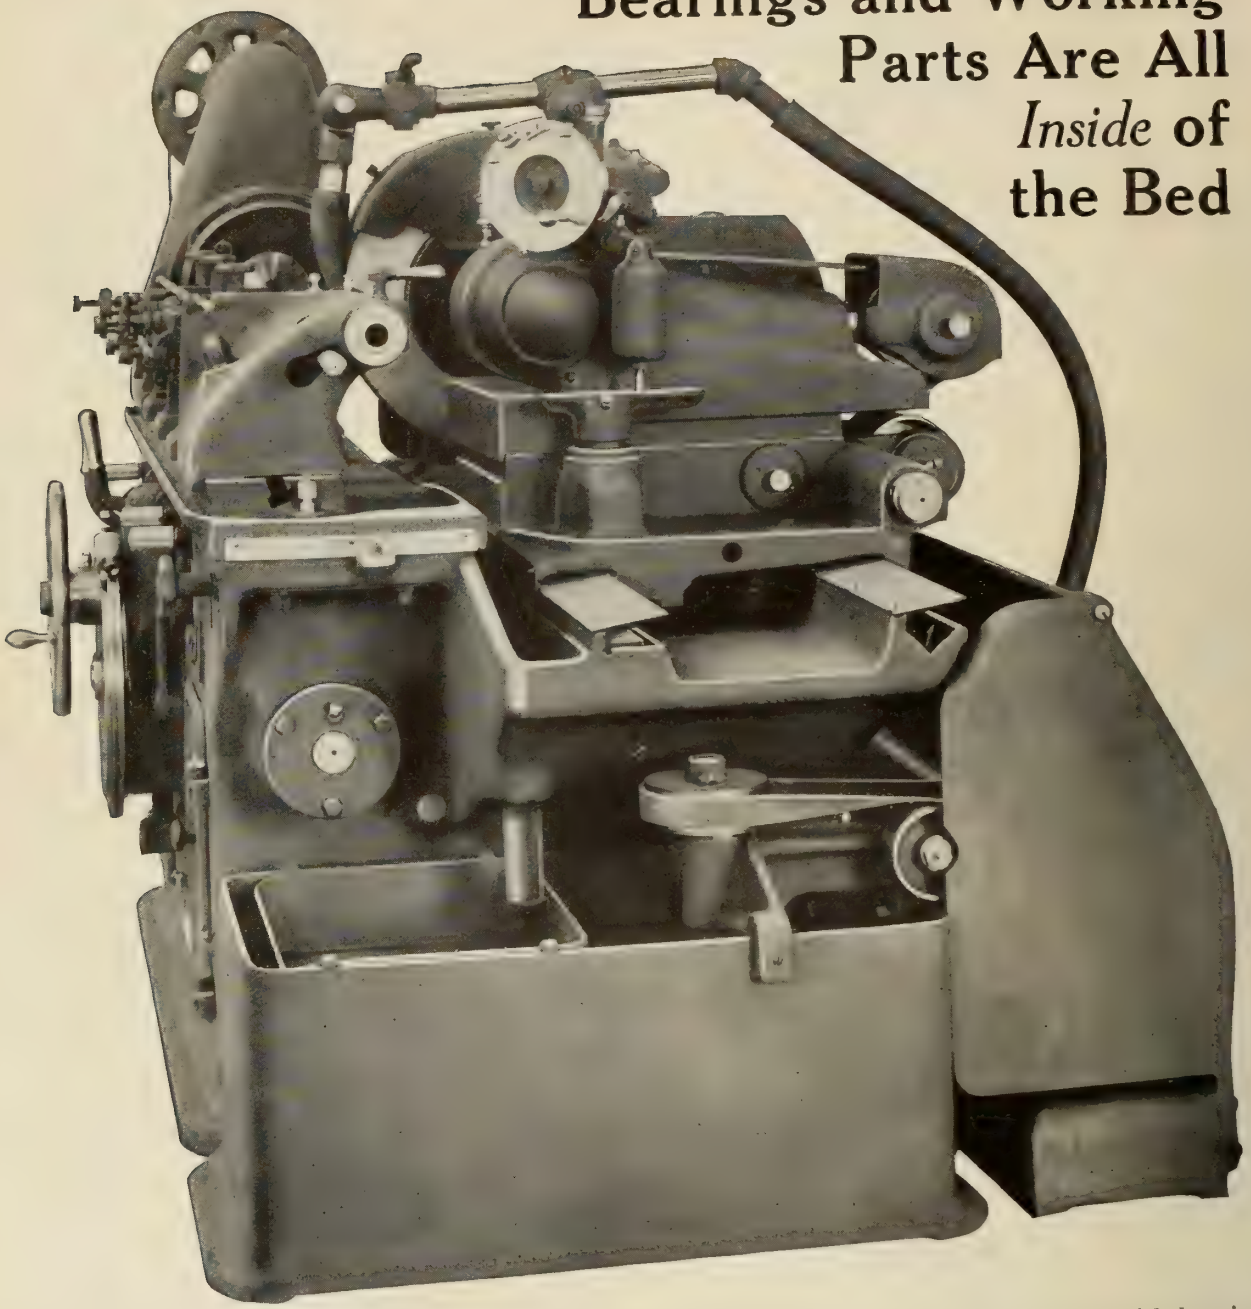
LANDIS

# Bearings and Working Parts Are All *Inside* of the Bed



CAN you conceive of more thorough protection? Notice the compactness and massiveness of wheel base and work carrying heads. Also note that the wheel head is directly over and between the carriage ways, which are set well apart.

Study the Landis Improved Self-Contained Grinding Machine from any angle; you will not find a single place where there is the remotest possibility for grit to come in contact with bearing surfaces or gearing.

Notice the wide shed fenders which protect the guide-ways of the wheel carriage. The wheel spindle is entirely enclosed, yet easily accessible and lubricated from sight feeding oil cups. Surely this illustration is convincing evidence of LANDIS thorough protection from grit.

# The Tap with the Con-eccentric Land

## For Tapping Nuts

**One-third of the land from the cutting edge is concentric. The remaining two-thirds has eccentric relief.**

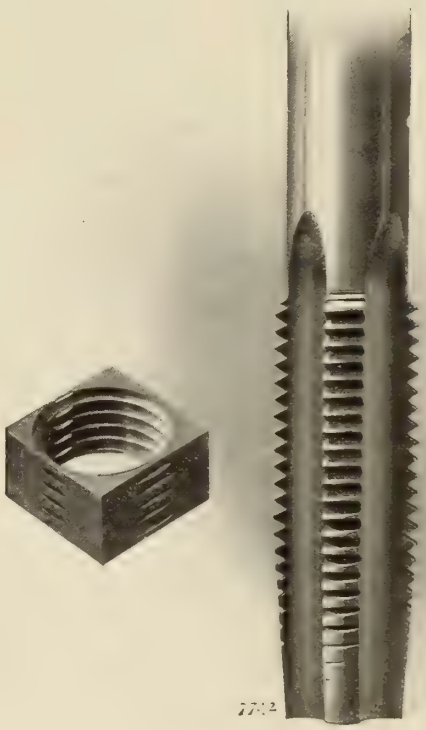
TO show more clearly the free-cutting qualities of these taps, a nut slightly smaller than one and one-quarter inches square was drilled for tapping and held lightly by the corners. The nut was then tapped with a 1¼-7 U.S.S. con-eccentric tap, driven through without reversing. (See cut on right).

So perfect were the cutting qualities and so easily and freely was the work done that this mere shell of a nut was *not even distorted,* to say nothing of being split as would have happened with a tap differently constructed.

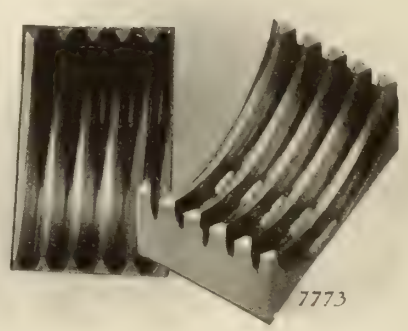
Consider what this means to the nut manufacturer from the standpoint of a *saving in power.* This is but one reason why Pratt & Whitney taps are specified by the largest nut manufacturers in the country.

For a number of years we have made taps with this style of relief. They have won out steadily and consistently on merit alone.

**Write for our Booklet "The Tap with the Con-eccentric Land."**



7772



7773

TAPS can be sharpened at the only correct point — on the face of the cutting edge.

Sharpening in no way affects their size.

Can be sharpened long after other so-called eccentrically-relieved taps are rendered useless.

We obtain the freest cutting tap with the longest life—an exclusive combination.

Accuracy nowhere else obtainable is secured together with a degree of finish and refinement heretofore thought impossible in a commercial tool.

We want tap users to know *why Pratt & Whitney taps are best,* also that our claims are based on reasons mechanically correct.

Cut to left is a tapped nut sawed in half showing small area of metal which held it together.

The taps are carried in stock by our Branch Offices and Agencies throughout the world. Prompt service assured to all customers wherever located.

## The Artillery of Commerce

¶ Sir John French is reported as having said, a few months ago, that what the Allies needed most of all was shells—"Shells, Shells, and then more Shells!"

¶ Events of the past few weeks have demonstrated the remarkable effectiveness of artillery, and have justified General French's urgent call.

¶ Without artillery there can be no infantry advance. Without the latter there can be no perceptible gain.

¶ The important details of occupation of captured territory is left to the infantry, but the importance of artillery in making advance possible cannot be denied.

¶ In the field of commerce, as in the field of battle, it is the artillery that counts—the powerful and effective shell fire of advertising.

¶ Its importance is recognized by the successful generals commanding the commercial forces, **on active service,** to-day.

¶ No matter how securely your competitor may imagine himself entrenched, **continuous and well-directed** advertising will dislodge him and allow you to establish your line well in advance of your present position.

¶ One shot is of little use except to find the range, but once you train your guns in the right direction and secure the proper elevation, you can truthfully announce each day, "Our forces have made a perceptible gain!"

¶ Advertising batters down the walls of prejudice and destroys the entanglements of set notions, and false ideas, that have been set up between you and the army of probable buyers of your product.

¶ Advertising is the artillery—your salesmen, your stenographers, your shippers, your whole staff of employees, and yourself, are the infantry that attend to the important details of occupation.

¶ And we might add for your especial benefit and advantage, that the famous German siege howitzers in the matter of range are but miniature popguns compared to such advertising guns as Canadian Machinery, which will shoot your most effective message across the continent, hitting hundreds of vulnerable spots, in record time, and, moreover, firing through Canadian Machinery is vastly cheaper than shooting through a gun of steel and bronze.

# Performance

When 230 pipe machines of the same make are sold in one city—when 158 are sold in another. When 65 out of 85 concerns in one city placed repeat orders—when one firm placed five repeat orders—performance of the machines must have played an important part. Such a record could not follow a machine unless it was an "honest to goodness" pipe machine. Each machine must have performed its part each working day, or it would have been branded a failure.

*Send for a catalog of the machine with a performance record.*

# GRINDING STEEL CASTINGS

in a swing frame grinder furnishes the most severe test of the worth of a grinding wheel. It's in work of this sort that the superiority of Norton Alundum Wheels is most clearly demonstrated.

Properly selected Alundum Wheels keep clean and sharp—and produce a finish it is impossible to equal by any other means.

# The Story of an Increased Production

WITH a certain make of wheel they were grinding 2,100 large gray iron castings in a Syracuse plant.

A Carborundum service man studied the grinding conditions and specified a Carborundum wheel of a definite grit and grade.

Now, with the right wheel in the right place, they are grinding 3,900 castings under the same conditions.

The Carborundum Wheel cuts faster, cleaner, shows longer life.

*Carborundum Service will help you to better bigger grinding results*

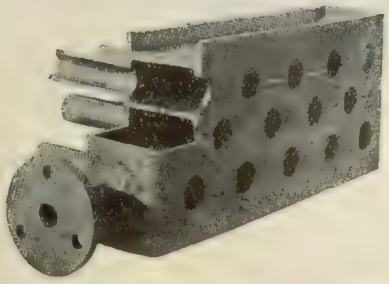
OXY-ACETYLENE WELDING and CUTTING PROCESS

No Shop, Foundry, Shipyard, Manufacture, Mill, Mine, Garage should be without it. A Money Saver. A Money Maker.

"Made in Canada" Goods.



Apparatus made of I-Beams, welded, to stand high pressure.

L'AIR LIQUIDE SOCIETY
(Paid-up Capital $2,200,000.00)

26 Boler St. WEST TORONTO — Maisonneuve— MONTREAL — 325 William Ave. WINNIPEG

EVERYTHING in the OXY-ACETYLENE LINE

We manufacture the MOST EFFICIENT OXYGEN,—by Claude's LIQUID AIR PROCESS.

Easy to Operate and Easy on Your Tools

Every feature in the design and construction of Bliss Presses has a reason that means a saving. In the case of Bliss Inclinable Power Presses, there is the double saving in maintenance costs of both machines and tools.

Bliss Inclinable Power Presses

These inclinable body presses are carried in stock in eighteen sizes and are adapted for the manufacture of tin cans, nearly all the operations in pieced tinware, metal packages, electrical goods, brass goods, trimmings, etc.

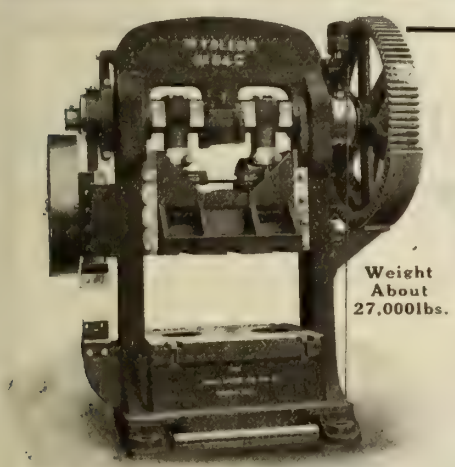
Catalog No. 2G is ready for your request.

*"Bliss Presses for Every Requirement"*

E. W. Bliss Co., 20 ADAMS ST., BROOKLYN, N.Y., U. S. A.

Chicago Office, 622 West Washington Street

BLISS



Weight About 27,000lbs.

The Strongest Evidence of Absolute Value is — Performance — and on "TOLEDO" Presses this has been proven by nearly half a century of practical service tests.

"Toledo" Trimming Presses mean Endurance, Service and Economy of operation. Outer slide fitted with improved adjustment, same as inner slide.

The "Toledo" powerful block or jaw clutch will stand more forge shop dust, grit and abuse than any other made for power press drive.

The frames are massive and all gears and exposed parts protected. Gibs are extra long and insure rigid support for slide during its entire travel.

No. 94C—for trimming automobile axles, brake levers, etc., as well as for operating gang dies for progressive trimming and forming.

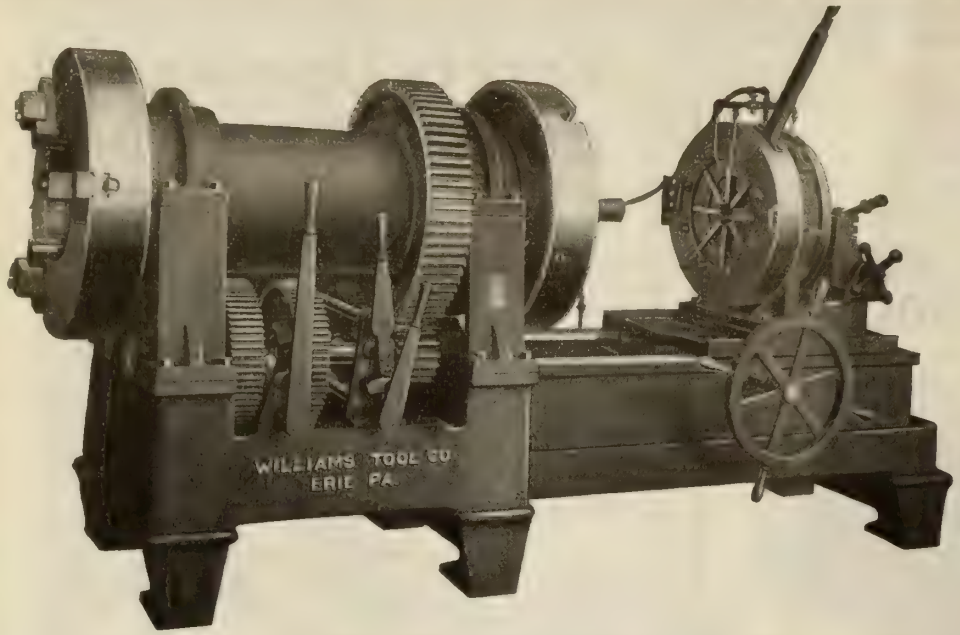
FOR HARD METALS — RAILWAY & TRAM TYRES "TYR"
OFFICE 22 VICTORIA SQ. MONTREAL — WORKS LONGUEUIL QUE.



The gas light was a big improvement over the tallow dip, but it had to give way to the electric light; and the Tungsten has superseded the little glimmer that once delighted us.

If you are still employing pipe-cutting methods as antiquated as the tallow dip, you need a Williams Pipe Machine, which occupies the same position in the pipe-cutting field as the Tungsten does in the lighting world, to bring you up-to-date.

*Let us quote you prices and terms: any machine to cut 10 sizes of pipe between 1-4 inch and 18 inch, with any kind of power.*

**Anyone making, selling or buying a pipe machine, claimed to be a Canadian-made Williams Pipe Machine, does so without right or authority from us, and is liable to prosecution for damages.**
